BY

#### T. HEWITT KEY, M.A., F.R.S.,

FORMERLY PROFESSOR OF MATHEMATICS IN THE UNIVERSITY OF VIRGINIA, U.S.;

THEN OF LATIN IN UNIVERSITY COLLEGE, LONDON;

NOW OF COMPARATIVE GRAMMAR IN THE SAME,

AND HEAD MASTER OF TITE SCHOOL.

LONDON:

BELL & DALDY, YORK STREET, COVENT GARDEN. 1868. 2/12/90

LONDON:

R. CLAY, SON, AND TAYLOR, PRINTERS, BREAD STREET HILL.

#### PREFACE.

The following Papers are in part now published for the first time, in part reprinted from the 'Transactions of the Philological Society,' but with many changes or additions. In the selection I have passed over several papers, because I wish to reserve them for a systematic treatise on language, the greater part of which is already ripe for publication.

I fear that some traces of haste will be visible in what I am now putting out; but I have two pleas in excuse: first, that the head-master of a school of nearly four hundred boys has little leisure for other work; and secondly, that such leisure cannot now be expected to be very productive for one who has entered his seventieth year.

I take the present opportunity of enumerating the various philological papers which have proceeded from my pen during the forty years or so in which I have been connected with University College, first as Professor of Latin (thirteen years) and then as Professor of Comparative Grammar (nearly twenty-seven years).

A. Quarterly Journal of Education, published by the Society for the Diffusion of Useful Knowledge:—

Vol. i. p. 89, Review of Zumpt's Grammar, in which I first put forth several of the new ideas which appear in my Latin Grammar.

Vol. ii. p. 143, Review of Sallust's Catiline and Jugurtha, as edited (1) by the Rev. W. Trollope, M.A.; (2) by Professor Charles Anthon, of New York.

Vol. ii. p. 344, School Editions of Terence, where (pp. 349-364, &c.) I first give my theory of Terentian metres.

Vol. iii. p. 312, Review of Crombie's 'Gymnasium.' Vol. iv. p. 134, Review of Allen's Treatise 'On Latin Particles.'

Vol. iv. p. 336, Review of Carey's 'Latin Prosody made Easy.'

B. Various articles in the Penny Cyclopædia, chiefly bearing on language. Among these papers was one on Terentian metres, in agreement with the article already mentioned as published in the Journal of Education. These papers were for the most part collected in a little volume entitled:—

C. 'The Alphabet, Terentian Metres, &c.;' with a new paper on 'Good, Better, Best, Well,' &c. 1844. To this was prefixed 'A Prefatory Letter' (to Mr. Long), with 'Remarks on the Varronianus of the Rev. J. W. Donaldson, 1844,' where I brought against him several distinct charges of plagiarism. The first published copy of this book was sent to him August 23d.

In 1849 there was a 'second issue' of this book, with a paper 'On the Pronouns of the Third Person.'

D. The publication of the above-mentioned 'Pre-

fatory Letter' led to a controversy with Mr. Donaldson, which took the shape of four additional pamphlets: first from him what he was pleased to call, 'A Reply to the Calumnies and Misrepresentations of Professor T. H. Key.' A copy of this I received on the 20th of November 1844. I at once wrote, and on the 30th of the same month sent him a printed copy of

A Rejoinder to the Reply of the Rev. J. W. Donaldson, B.D., in a second 'Letter to G. Long, Esq. M.A. &c.;' to which I attached a paper on

The Formation of the Latin Perfects amavi, &c.

On the 13th of December I received his second pamphlet, entitled 'A Brief Examination of Professor Key's Rejoinder;' and on the 8th of the following January I sent him again in print—

Comments on Mr. Donaldson's Brief Examination of a Rejoinder, &c.

All the five pamphlets in the year 1845 I had reprinted, and distributed in private circulation nearly five hundred copies, which produced from him a threat that he would apply to the Court of Chancery for an injunction,—a threat however that ended, as I expected, in nothing; for although of course I had no legal right to print what he had written, yet I felt justified in so doing, because he had implied that I looked forward to a verdict in my favour in the sole hope that my readers might not see his replies.

E. In 1846 I published—

A Latin Grammar on the System of Crude Forms; and in 1862 what I may call a third edition of the same, 'corrected and somewhat enlarged.'

F. Proceedings of the Philological Society, vol. ii.

p. 50: On the English Verb do and the Latin dare; and On the Formation of the English Weak Perfects.

*Ibid.* p. 143: On the Relations which exist between the Preterite went and the Verb go; and also between va and the Verbs aller and andare.

*Ibid.* p. 180: The Lapp and Finn Tongues not unconnected with the Indo-European Family.

Ibid. p. 249: On the Origin of certain Latin Words.Ibid. vol. iii. p. 45: On the Misuse of the TermsEpenthesis and Euphony.

*Ibid.* p. 57: On the Origin of the Demonstrative Pronoun, the Definite Article, the Pronouns of the Third Person, the Relative and the Interrogative.

*Ibid.* p. 115: On the Names of the Parts of the Human Body, as common to the several Families of the Indo-European Language.

 $\mathit{Ibid}.$  p. 130 : On apparent Exceptions from the Triliteral Form of Monosyllabic Roots.

*Ibid.* p. 136: On the Chronology of the Catilinarian Orations.

Ibid. p. 205: On the Origin of certain Latin Words.Ibid. vol. iv. p. 25: On the Pronouns of the First and Second Persons.

*Ibid.* p. 87: An Attempt to prove the Identity of the Roots is, was, and be.

*Ibid.* vol. v. p. 51: On the Nature of the Verb, particularly on the Formation of the Middle or Passive Voice.

Ibid. p. 89: On the Derivation and Meaning of certain Latin Words.

*Ibid.* p. 103: On the Etymology of certain Latin Words.

*Ibid.* p. 191: On Vowel-assimilation, especially in relation to Professor Willis's Experiment on Vowel Sounds.

Ibid. vol. vi. p. 63: On the Imperfect Infinitive, Imperfect Participle, and those Substantives which fall under the definition 'Nomen actionis.'

Ibid. p. 93 : Miscellaneous Remarks on some Latin Words.

*Ibid.* p. 117: On some alleged Distinctions in Languages believed to be without foundation.

Ibid. p. 127: On the Etymology of  $\dot{a}\pi\lambda oos$ ,  $\delta\iota\pi\lambda oos$ , &c.

Ibid. p. 138: On the Etymology of στοα.

*Ibid.* p. 139 : Some Remarks on the Speech 'Pro Plancio.'

*Ibid.* p. 152: On the Etymology of *circumforaneus*, *circulator*, *cento*.

Ibid. p. 155: A Translation (from the German) of Ahren's Paper, 'On Feminines in ω and ωs; and on the word γυνη.'

Ibid. p. 188: A Translation (from the Italian) of Dr. G. Henzen's Paper, 'On the Inscription of Sora.'

G. Transactions of the Philological Society—vol. for 1854, p. 26: On the Derivation of maritimus, aeditimus, finitimus, legitimus, miles, and diues.

*Ibid.* p. 29: A Search in some European Languages after the Representatives of the Greek Preposition *ava* as prefixed to Verbs.

An unfavourable review of this paper appeared in Kuhn's 'Zeitschrift für vergleichende Sprachforschung,' vol. iv. pp. 217—219; but the editor, with somewhat

unusual courtesy, gave admission to a reply from me (zur Erwiederung) in vol. v. pp. 72-80.

Ibid. p. 72: On the Meaning of adaequare.

Ibid. p. 85: On the Prepositions  $\epsilon\nu\iota$ , in, and related Words.

*Ibid.* p. 131: On the Etymology of the Verb *obsolescere* (but see pp. 200, 220).

Ibid. p. 199: On the Use of the Reflective form deuerti.

Ibid. p. 206: On Metathesis.

*Ibid.* vol. for 1855, p. 1: On the Latin Verb *mittere*, its Origin and Affinities; and generally on Verbs signifying 'to *go*' in the Indo-European Family.

*Ibid.* p. 96: On the Derivation and Meaning of the Latin Verb usurpare.

Ibid. p. 119: On Greek Accentuation.

Ibid. vol. for 1856, p. 219 : On Diminutives.—I. English.

*Ibid.* p. 195: (On Diminutives.—II. Latin; or) On the Representatives of the Keltic suffix agh or ach 'little,' in the Latin Vocabulary.

Ibid. vol. for 1857, p. 115: On the Word Inkling. Ibid. vol. for 1859, p. 136: On the Derivations of duntaxat, tranquillus, and si in si dis placet.

Ibid. p. 140: On the Derivation of the Gothic hanfs one-handed.

Ibid. p. 143: On the Derivation of the Word  $\delta\eta\mu os.$ 

*Ibid.* p. 145: On the Convertibility of n and d.

Ibid. p. 273: A Supplemental Paper on the Keltic Suffix agh, &c. as occurring in Latin, Greek, and other Languages.

*Ibid.* vol. for 1860-1, p. 172: Miscellaneous Remarks suggested by Ritschl's Plautus, especially on the Formation of the Latin Perfect.

Ibid. vol. for 1862-3, p. 1: Miscellaneous Papers: (A) On altero- and its Analogues; (B) On Words which denote 'Waterfowl' and 'Swimming;' (C) On επ of ευπευν (inquit) and έπ of έπομαι (sequor); (D) On alaceri- and some related Greek Words; (E) On uiuere, &c.

*Ibid.* p. 113: The Sanskrit Language as the Basis of Linguistic Science, and the Labours of the German School in that Field—are they not over-valued?

Ibid. p. 213: On titillare and τικτειν.

*Ibid.* p. 216: The Anglo-Saxon Language called in aid to support the Doctrine which attributes a Suffix agh or ag to Latin Verbs.

*Ibid.* vol. for 1865: On the so-called 'A privativum.'

*Ibid.* vol. for 1866, p. 1 : *Daughter* and *Fille*, are they connected ?

*Ibid.* p. 25: On the Latin Words temere and temerare.

*Ibid.* p. 30: On the Latin Prepositions re and pro; their Origin and Primitive Meaning.

Ibid. p. 49: The Latin et, que, atque (ac), and the Greek  $\kappa a\iota$ ,  $\tau \epsilon$ , all of one Origin.

*Ibid.* vol. for 1867, p. 1 : On the Formation of Greek Futures and First Aorists.

H. Bell's English Journal of Education. Thirteen papers on Latin Etymology, signed 'Claudius,' viz.:
I. July 1850, p. 254; II. August, p. 292; III. September, p. 310; IV. October, p. 354; V. November,

p. 402; VI. January 1851, p. 1; VII. March, p. 69;
VIII. April, p. 109; IX. May, p. 149; X. June,
p. 196; XI. July, p. 240; XII. August, p. 281;
XIII. September, p. 313.

I. A Review of Smith's Latin Dictionary in the Westminster, July 1855.

As my arguments touched upon moral questions as well as matters of scholarship, I was the more unwilling to take shelter under the anonymous, and accordingly gave him formal notice that I was the writer.

J. Knight's English Cyclopædia, article 'Language.'

One object in entering into these particulars has been to correct some errors which have appeared in certain classical publications, and are believed to prevail somewhat widely. In an edition of the Adelphi by the Rev. Wharton B. Marriott (formerly Fellow of Exeter College, Oxford, and late Assistant Master of Eton), 1863, the second part of the Introduction deals with the metres of Latin comedy, and to the views of Bentley are opposed those of 'more recent scholars' (p. 13); and he then proceeds to discuss 'the main ground these "recent scholars" take up,' adding a note,—

'See particularly the article on Terentian Metres in the Penny Cyclopædia, evidently by Professor Donaldson; and the chapter of the same author's Varronianus (xiv.), on the Constitution and Pathology of the Latin Language.'

Soon after, in § 5, he speaks of 'the three kinds of

evidence they adduce in support of (their) view; and then says, 'The two first of these arguments have already been stated by Donaldson (Varron. pp. 433, 437, sqq.) in a way that leaves nothing for others to add.'

Again, his notes (vv. 688 and 899) on the pronunciation first of *item quidem modo*, and then of *student* and *facere*, refer to Donaldson's 'interesting chapter' as the source of his information.

On my first seeing Mr. Marriott's book, I wrote a note to him in which I pointed out that he had fallen into a very natural mistake in ascribing to the author of the Varronianus the paternity of the article Terentian Metres in the Penny Cyclopædia, for this article and the corresponding chapter in the Varronianus evidently proceeded from the same pen; but that the simple fact was that the article in the Penny Cyclopædia was written by me, and dishonestly appropriated by Donaldson. He at once favoured me with a courteous reply, in which he admitted his error, and at the same time assured me that the mistake he had made was one of general currency.

And in fact I find that the editor of Terence in the 'Bibliotheca Classica' shares the error, for he also commences his Introduction on the Metres of Terence (p. xxviii.) thus:—

'This subject has been noticed by the author of the Varronianus (chap. x.), who refers to the Journal of Education (vol. ii. p. 344, &c.), where it is treated generally in a manner which leaves nothing for others.'

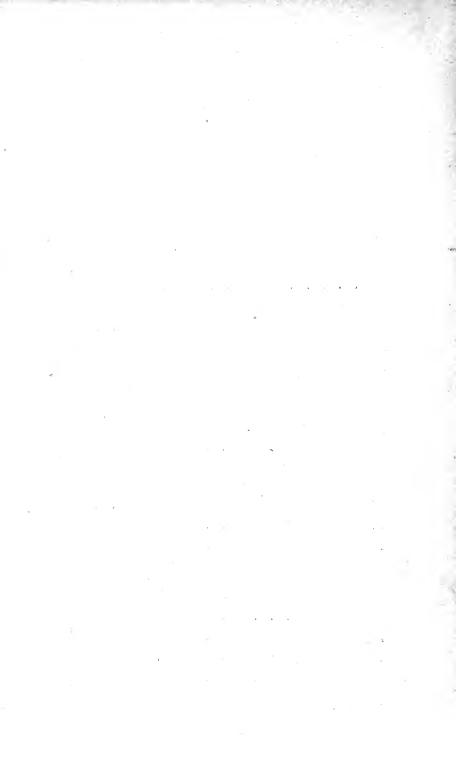

When he wrote these words, I have little doubt that, in his own mind, Mr. Parry ascribed to Dr. Donaldson

the authorship of the article in the Journal of Education, for in his preface (p. ix.), after saying that 'the question of Terentian language and metre is a subject which has till lately lain fallow in England since the time of Bentley and Hare,' he adds in a note, 'When I wrote this sentence, I had not seen Mr. Key's Essay on the Metres of Terence and Plautus. My only acquaintance with his researches was through the Varronianus.' Now the whole of the chapter of the Varronianus in question is, with two petty exceptions, an unmitigated plagiarism by Donaldson from my two articles on Terentian Metres, that in the Journal of Education and that in the Cyclopædia. One exception is the doctrine that homines (in the Phormio, v. 1, 37) is a monosyllable (!). The honour of this is all his own. The other is that puellam in Haut. v. 5, 16 is to be pronounced pullam. It must have been somewhat grating to Dr. Donaldson's conscience to find that Mr. Parry, amid his general approval of his chapter on the comic metres, selects this one remark for disapproval (p. xxxv. note).

I confess that it is not satisfactory to me that my views should come to the knowledge of scholars through the medium of Donaldsonian writings; and I have deemed it a duty to print these pages, although the offender has now passed away. I never thought it necessary to notice the abusive or contemptuous terms in which I have been habitually alluded to in the later editions of the Cratylus and Varronianus, for such abuse I heeded as little as I did the flattery he bestowed upon me in the first edition of the former work.

### PHILOLOGICAL ESSAYS.

I.

#### ON THE REPRESENTATIVES OF ava IN ALLIED LANGUAGES.

THE little syllables which are prefixed or affixed to roots in the process of word-building were probably at the outset possessed of an importance equal to that claimed for the roots to which they are attached; in other words, they also are roots; but, supporting for the time an inferior part, are of course subject to be treated with some indignity beside the greater personage on whom they wait. Thus it will be often found that both prefixes and suffixes are curtailed of their fair proportions. But among such secondary syllables, none perhaps suffer more abridgement or alteration than the prepositions used in the composition of verbs, especially those which fall under the class called by German grammarians inseparable. Grimm has particularly noticed this liability (Deutsche Grammatik, ii. 865).

'The doctrine,' says he, 'which holds true generally of particles, that they become obscure in signification and disguised in form, is specially applicable

to the inseparable particles. The notion which they express wavers between increased intensity and a privative character, or occupies an intermediate position. The form again passes commonly through all the vowels, and at last fades away into an unaccented e, while the consonants either drop off or are modified by the influence of the initial consonant of the word which is brought into contact with them. One particle indeed (our ge-), in the vulgar dialect, has sunk down into an almost imperceptible breathing. The more this corruption of a particle develops itself, the less capable does it become of maintaining the independent and separate character which it first possessed.'

Greek scholars in this country will probably give a ready assent to the power which Kühner assigns to the preposition  $a\nu a$  in the etymological portion of his grammar (§ 365, 2): ' $d\nu a$ , auf (hinauf).' At any rate up is the notion which distinctly presents itself in a large number of the verbs compounded with  $a\nu a$ .¹ But German authors have allowed themselves to be biassed by the tempting similarity between the Greek  $a\nu a$  and the Gothic and old German preposition ana, which in modern German takes the shorter form of an, the equivalent of our an; and hence in his syntax, § 602, Kühner writes: '' $A\nu a$  [old Germ. ana, and as still written an with the dative and accusa-

<sup>&</sup>lt;sup>1</sup> It is a somewhat strange fact that Matthiae, in his large grammar of more than a thousand pages (at least in the English translation), gives not a word which can lead his readers to the true sense of ava. His examples are limited to such as he translates by on, in, throughout, against, with, or by phrases of distribution. On the sense which ava brings to verbs in composition he is utterly silent.

tive]. The fundamental signification of the preposition  $\partial u\dot{\partial}$  is on, up (an, auf). In justification of the sense on, Kühner gives no examples but  $\partial u\dot{\partial} u\dot{\partial$ 

In the course of this paper the real representative of the Greek ava on German ground will be pointed out, together with the arguments necessary to establish its claim. For the present I must deal with ava alone. Now the chief meanings which belong to this preposition are the following: 1, up, as ανα τον ποταμον, ανα ροον πλειν; ανα νωτα θεουσα; 2, it is often convenient to fancy an acclivity, where none may actually exist, and thus on the most level ground we may speak of going up this line and down that. Hence we get the meaning of along, through, as arm νηαs, αστυ, πεδιον. 3, from through in place we pass readily to through in time, during, as ava νυκτα 'all night long, ανα τον πολεμον 'throughout the war.' 4, that the idea of distribution, which is so common in this preposition, is in immediate relation with that of along or through, is often seen physically; for example, when a postman distributing his cargo of letters passes along the streets as he leaves them at the successive houses. So an epidemic passes through a camp, attacking one soldier after another. I purposely pass over the statement that ava with numerals

signifies up to, full, as is stated in a lexicon of repute, or auf (circa) as Kühner would translate it, because in the passages (Hom. Od. ix. 209, Herod. iv. 101) quoted or referred to, the distributival sense seems to prevail; but of course, when more decisive instances are produced, I shall readily welcome a usage which is perfectly consistent with the sense of the preposition, as our own construction, 'up to three hundred,' serves to show.

I next pass to what more concerns me, the use of ava in composition with verbs; and here the important bearing of the subject upon the future arguments must be my apology for entering into fuller detail.

1. The sense of up is, as I have already said, too evidently exhibited in the compound verbs to render a collection of instances necessary to establish it. with a view to matter which will subsequently come under consideration, I would draw attention to certain classes of verbs in which this sense of up is prominent; as, a. verbs with the idea of flame, heat, &c. ascending:  $a\nu$ - $a\iota\theta$ -,  $-a\iota\theta\nu\sigma\sigma$ -,  $-a\pi\tau$ -,  $-a\nu$ -,  $\beta\rho\alpha\sigma\sigma$ -,  $-\delta\alpha\iota$ -,  $-\zeta\epsilon$ -,  $-\theta\nu\mu\iota\alpha$ -, -και-, -καχλαζ-, -λαμπ-, -πρηθ-, -πυρο·, -φαιν-, -φλεγ-, -φλυ-; b. verbs of searching or investigating, in which ava seems to signify up to the very sources: av-eip-(r.), -ερευνα-, -ερωτα-, -εταζ-; ανα-ζητε-, -κριν-, -μανθαν-, -μαστευ-, -μηλο-, -πυνθαν- (r.), -σκοπε-;—c. loud noise, where the loudness is attributed to ava, just as we ourselves say 'speak up, raise your voice, you speak too low to be heard.' Under this head Liddell and Scott's Lexicon furnishes some thirty or forty

Of the phrases are stone, are  $\theta v \mu o r$  exer; and are tous protous even, mention is made below.

examples, some of which however perhaps belong to § 6.

- 2. As downward motion, by the law of gravity, is the natural course of most visible bodies, the idea of *up* is connected with reversed action. Hence the sense of *back* is found in more than thirty compounds in the same lexicon.
- 3. But to go back is to go over the same ground again. This idea, again, occurs as frequently as the last. I will only quote the examples ava-γιγνωσκ- and ava-γινωριζ- 'know again, recognise'; and ava-μιμνησκ-, 'remind.'
- 4. But to retrace one's steps is another phrase for the reversal of some preceding action, where the English prefix is commonly un. Hence av- $a\rho a$  (r.) 'recall a curse,' ava- $\delta\iota\delta a\sigma\kappa$  'unteach,'  $-\epsilon\lambda\iota\sigma\sigma$  'unroll,'  $-\epsilon\nu\chi$  (r.) 'recall a prayer,'  $-\kappa a\lambda\nu\pi\tau$  'unwrap,'  $-\kappa\lambda\omega\theta$  'untwist (what has been spun),'  $-\kappa o\lambda\nu\mu\beta a$  'come to the surface again after diving,'  $-\kappa\nu\pi\tau$  'raise (the head) again after stooping,'  $-\mu a\nu\tau\epsilon\nu$  (r.) 'make an oracle invalid,'  $-\pi\tau\nu\sigma\sigma$  'unfold,  $-\sigma\kappa\epsilon\nu a\zeta$ -1' dismantle,'  $-\sigma\phi a\lambda\lambda$  'rise up after a fall,'  $-\sigma\phi\rho a\gamma\iota\zeta$  'unseal,'  $-\tau\nu\lambda\iota\sigma\sigma$  'unroll.'
- 5. Sometimes the simple verb already in itself expresses the idea of *loosening*, *stripping*, *opening*; and then the prefix appears only to strengthen the idea of relaxation: and yet there will often be found some-

¹ Ανασκευαζ· we are told means 'strictly to pack up the baggage (τὰ σκεύη), Lat. vasa colligere, and so to carry away, Xen. An. vi. 2, 8: usu. in Med. to break up, march away.' Why not 'dismantle' here, as in the other uses of the word? This would be in agreement with the phrase just quoted from the lexicon, 'break up;' and indeed it is usual for a series of acts to take their collective name from the first in the series.

thing more than this, viz. a reference to a previous act of binding, &c. This in English is the case with 'to unloose,' not so with 'to loosen;' and similarly  $\tau\eta\kappa$ -'melt' is applicable to things which in their natural condition are solid, whereas  $a\nu a-\tau\eta\kappa$ - implies a return to a former condition, and can only be used of thawing congealed fluids. Examples of such words are  $a\nu a-\gamma\nu\mu\nu$ -,  $-\delta\epsilon\rho$ -,  $-o\nu\gamma$ -,  $-\pi a\nu$ -,  $-\tau\eta\kappa$ -,  $-\chi a\lambda a$ -,  $a\nu$ - $\iota\eta\mu\iota$ , and  $a\nu a-\pi\epsilon\tau a\nu-\nu\nu\mu\iota$ .

- 6. The idea of opening or discovery is also seen in other compounds with ava, where the simple verb denotes some means by which the opening is effected. Here again not unfrequently our own language also consistently expresses the idea by up: αν-ευρισκ- 'find out,' -ευρυν- 'widen,' ανα-κεαζ- 'split up,' -κλιν- 'bend back (a door) and so open,' -ξαιν- 'tear up or open a wound,' -ἡηγυυμι 'break up or open,' -σχιζ- 'split up,' -τεμν- 'cut up,' -χαιν- 'gape open.'
- 7. From the idea of opening we readily pass to that of commencing, where again up is at times used in English. Thus we say: 'open a ball, open fire, strike up a tune.' To this head perhaps belong the following words, where the translation is borrowed from the lexicon already named:  $-a\nu a-\kappa o\kappa \kappa \nu$  'begin to crow,'  $-\kappa \rho e\kappa$  (r.) 'begin to play (a tune),'  $-\kappa \rho o\nu$  (r.) 'strike up (a tune) or begin a speech,'  $-\mu \epsilon \lambda \pi$  'begin to sing,'  $-\beta a\lambda \lambda$  (r.) 'begin (anything),  $-o\delta \nu \rho$  (r.) 'break into wailing,'  $-\phi \nu \sigma a$  'begin to blow,'  $-\dot{\rho} a\psi \omega \delta \epsilon$  'begin singing;' and perhaps we should not be wrong in translating  $a\nu a-\gamma \epsilon \lambda a$  'burst out laughing, set up a laugh.'
- 8. The idea of back is in close connexion with those of escaping, removal, away: ava-κομίζ- (r.) get safe

away, escape, ' $-\phi \epsilon \nu \gamma$ - 'escape,'  $-\phi \circ \beta \epsilon$ - 'frighten away,'  $-\dot{\rho} \nu$ - (r.) 'rescue.'

- 9. Indeed the idea of removal also connects itself directly with the idea of up, inasmuch as motion upward is in many cases a convenient or even essential preliminary. Thus in Latin ferre, tollere, sustuli have for their first sense 'to raise,' and only in a secondary way signify 'carry off.' Examples are  $av-a\iota\rho\epsilon$  'take up and so carry away,'  $av-a\rho\pi a\zeta$  'snatch up and carry off,'  $ava-\kappa a\theta a\iota\rho$  'clean up or clear up,'  $-\sigma\pi o\gamma\gamma\iota\zeta$  'sponge up,'  $-\psi a$  'wipe up,'  $-\pi\epsilon\tau$  (r.) 'fly away.'
- 10. As the idea of through is often expressed by ava in company with nouns, so we have  $ava-\pi\epsilon\iota\rho$  'pierce through, spit,'  $-\tau\iota\tau\rho\alpha$  'bore through,'  $-\pi\eta\gamma\nu\nu\mu\iota$  'transfix.'
- 11. Hence we may perhaps deduce thorough distribution, an act pervading all parts, as seen more or less in: ava-διδωμι 'distribute,' -ξυμο- 'leaven thoroughly,' -κεραννυμι, -κιρναμαι, -μιγνυμι and -μισγ-, -φυρ-, 'mix thoroughly, mix up.' But very possibly a better interpretation, so far as regards the verbs of mixing, may be obtained directly from the idea of upward movement, seeing that the process of mixing is a constant battle with the heavier ingredients which persist in sinking. The truth of this will be felt by any one who has mixed a bowl of salad or a powder containing calomel.
- 12. The idea of completeness or thoroughly might well be expected in compounds with ava, and accordingly we find this meaning attributed to av-apµoζ-, -aισιμο-, -ελεγχ-; ava-βιβρωσκ-, -ζωγραφε-, -πρι-. Even of these some may be doubted, and at best the list is very short. The explanation of the paucity may perhaps

be this. It was noticed above that  $a\nu a$  obtained its sense of 'through' from the notion of a fictitious acclivity, where a person goes up this line and down that. Hence  $\kappa a\tau a$  'down' would be entitled to share the privilege, and accordingly this preposition is equally used in distributival phrases, as  $\kappa a\tau a \phi \nu \lambda a$  'by tribes,'  $\kappa a\tau'$   $a\nu \delta \rho a$  'man by man,' &c. On the same principle it is well calculated to express 'thoroughness' with verbs. This office it performs in the Greek vocabulary to a great extent, being in much higher favour for the purpose than  $a\nu a$ , whereas with us the word up is more in vogue. Hence  $\kappa a\tau - \epsilon \sigma \theta \iota$  'eat up,'  $\kappa a\tau a - \pi \iota \nu$  'drink up,'  $\kappa a\tau a - \pi \iota \nu$  'drink up,'  $\kappa a\tau a - \pi \iota \nu$  'use up.' '

In a few instances the idea of on or at is said to be the signification of  $a\nu a$ , as in  $a\nu - \epsilon \iota \rho$ — 'fasten on,'  $a\nu a-\kappa o\lambda \lambda a$ ,— 'glue on,'  $a\nu a\rho \rho a\pi \tau$ —, 'sew on.' But here we seem to have a totally different preposition, the analogue of the Gothic ana, German an, signifying 'on.'

I find that I have spent many more words upon this preliminary matter than I had intended. My apology must be, that I knew of no grammar or dictionary in which the subject was handled in sufficient detail. Nor indeed is there any part of language more commonly neglected in grammars, for to them the question properly belongs, than the power of prepositions as prefixed to verbs. At the same time, what I have said seems necessary for the just appreciation of the evidence I shall have to adduce; and I have now

<sup>&</sup>lt;sup>1</sup> It should be stated that, in drawing up these lists of compound verbs, I have relied almost exclusively on the excellent lexicon of Liddell and Scott, an acknowledgment I am the more bound to make, as I have ventured at times to criticise some of their statements.

the satisfaction of knowing that Pott in his new edition of the Etymologische Forschungen (p. 305), has adopted my distribution of the meanings of ava.

After this preface, the first problem is, whether the Latin language has any representative of ava. My answer is, that it has at least one, and, as I believe, no less than three, or even four representatives. ava should appear in Latin without a final vowel is what is to be expected when we compare the cases of aπo and ab, επι and ob, παρα and per in perjurus, ενι and in. Further, in Greece itself ava was reduced to aν in some forms and dialects, just as κατα, παρα, ενι were to  $\kappa a \tau$ ,  $\pi a \rho$ , and  $\epsilon \nu$ , and this especially in those dialects which have the closest affinity to Latin, the Doric, and Æolic. Now in three words, ancisus, (Lucr. iii. 660), anguir-, and anhela-, the form an has been preserved; but for all of these a word of remark seems necessary. Lucretius is speaking of a snake suddenly divided into many parts, and yet in these several parts still exhibiting signs of vitality for a while .

> "Omnia iam sorsum cernes ancisa recenti Volnere tortari."

Here therefore ancisa is no compound of am, as Forcellini would make it; but clearly means 'cut off, or cut through.' Anquir- seems to have for its meaning 'search up to the sources,' and indeed avapacter is explained by Liddell and Scott as = anquir-. Anhelais used of those violent up-blowings which follow volcanic action, as in Cic. anhelitus terrae, and Ovid, Fast. iv. 491; also of the flame driven out by a furnace-blast, or from the nostrils of Colchian bulls. Comp.

ava-φυσα-, whence ava-φυση-σι- 'the blow-hole of a crater,' and ava-φυσια- 'blow as a dolphin.' At any rate such an explanation of anhela- seems more satisfactory than what we find in Andrews's Lexicon, who gives as the 'literal' sense: 'to draw the breath from around the whole body.' This translation no doubt proceeded on the assumption that the word contains the prefix am 'round,' although in this case it should have been am-hela-, if we may judge from am-ici-. But besides this, an-hela- clearly means an expiration rather than an inspiration.

Of course before a labial an would pass into am, and accordingly we have am-puta- 'cut off,' am-mone- 'remind' αναμιμνησκ-, am-bur- 'begin to burn, singe,' am-bed- 'begin to eat,' 'nibble at.' Cf. our own burn, bite. The notion of am 'round,' is inconsistent with the meaning of both am-puta- and am-mone-; and the form ammone is that which for Ovid's Fasti has by far the best authority, if we may take for our guides those MSS. which Merkel himself collated.

Assimilation also accounts for the forms alleva'lift up,' alliga- 'tie up,' and the impersonal allubescit of a commencing love, for in all these the
notion of ad 'to,' seems out of place. The first has
for synonyms in Forcellini, 'sublevo, in altum tollo,
sursum levo.' As for alliga-, it is enough to quote
the phrase alligare vulnus, and to note that Pliny,
when he has occasion for the idea 'tie to,' or rather,
'tie up to,' uses adalliga-; but a verb twice compounded with the same preposition would be something strange. Alloqui too is very insufficiently
translated by the verb 'address.' It means to 'console,
cheer up,' and so is clearly a compound of an.

Again, before s an n would of course be silent; and so we have an explanation of such forms as assicca'dry up' = avaξηραιν-, assudesc- 'burst out into a sweat,' and assurg- 'rise again.' In such phrases as majoribus natu assurgere, both the notion of ad and that of ava are intelligible, but in all other uses of this verb, that of ava alone is admissible, especially in sentences where the notion of 'get up again' after a fall is implied, as in 'Galli neque sustinere se prolapsi neque adsurgere (assurgere?) ex voraginibus poterant' (Liv. xxii. 2); and again: 'Tetra ibi luctatio erat . . . in prono citius pede se fallente ut seu manibus in adsurgendo seu genu se adjuvissent, ipsis adminiculis prolapsis (or prolapsi) iterum corruerent' (xxi. 36).

I next take cases where in place of an I find but a simple a to represent the prefix. Here again we have what is parallel to the usage of Greece. In the Doric and Æolic dialects (see Ahrens, De Dialectis), if the simple verb began with a  $\sigma$ , followed immediately by another consonant, the fuller form av, or its equivalent, ov, dropped its nasal. Accordingly we find in Latin a-scend- opposed to de-scend-, a-spira-'exhale' ('pulmones se contrahunt aspirantes,' Cic.), a-stru-'build up,' opposed to de-stru-; a-sta-, as used in Plautus without any meaning of ad, e.g. 'Haut ineusceme (for so the MSS.  $= avevo\chi\eta\mu\omega s$ ,) astite-runt,' 'no inelegant pose that' (Trin. iii. 1, 24). On the same principle we have a-gnosc- 'recognise,' = ava-yyy $v\omega\sigma\kappa$ -.

Thus already we have a respectable stock of words in which an assumed an, = ava, has all in its favour alike as to form and meaning. But I also venture on

the assertion, that a visible ad in Latin compound verbs not unfrequently stands as a substitute for our an; so that the language had in fact for the composition of verbs two prepositions of this shape, which it is important to distinguish. The interchange of an n and d is what most philologers will readily admit, and indeed the relation between these letters is precisely the same as that between m and d, and as that between the nasal d0 (of d0). Only when the nasal passage is in communication with the wind-pipe, have we d0, d0, and d0; but the moment this passage is closed by the d1 velum d2 palati, these respectively pass into d2, and d3. (See Mr. Weymouth's paper on this subject, in the Transactions of the Philological Society' for 1856, page 21, and the work of Blindeisen, to which he refers.)

But I cannot now stop to discuss this point at any length. Assuming that a preposition an may well take the form ad, I request attention to the following: acclivi- 'up-hill,' opposed to de-clivi-, 'down hill;' accresc- 'grow up,' by the side of de-cresc- 'grow down;' as in 'Valitúdo mi decréscit, accrescít labor' (Plaut. Curc. ii. 1, 4); acced- 'rise as the tide,' and deced- 'ebb;' ad-olesc- 'grow up,' but ab-olesc- 'cause to grow down;' ad-aestua- 'boil up,' apprehend- 'take up,' accumula- 'heap up,' agger- 'heap up,' ad-imple- 'fill up, ad-aequa- 'raise¹ to a level (with),' ad-operi- 'cover up,' atting- 'begin to touch, lay a finger upon,' ad-juva- 'lift up,' and accumbo 'I lie with the body raised,' as on a dinner couch, = ava-κειμαι.

<sup>&</sup>lt;sup>1</sup> In Livy i. 29 we ought to read, omnia tecta solo aequavit (not adaequat).

Secondly, the notion of 'again' has already been seen in *a-gnosc-* and *ammone-*, which by some are written *adgnose-* and *admone-*.

Thirdly, the reversal of an act was common with ava, but for ad I can only produce acquiesc- 'rest after labour,' identical in sense and perhaps in form with ava- $\pi$ ave $\sigma\theta$ ai, seeing that the Latin loves to have q as the analogue of a Greek  $\pi$ .

Fourthly, ad-aperi- bears a close analogy to av-oiy-; and as in discussing the powers of ava I deduced from the idea of opening that of commencement, so in Latin I find ad-ama- 'fall in love,' ad-mira- (r.) 'be suddenly seized with wonder,' affle- 'burst into tears,' ad-dormisc- 'fall asleep,' ad-hinni- 'set up a loud neigh,' accend- and ad-ole-1'set on fire,' ad-gem- 'all at once sigh,' ad-vesperasc- 'begin to be dusk,' ad-esuri- 'be seized with a fit of hunger.'

The physical notion of through clearly resides in ad-iq- 'drive through, pierce, transfix.'

Again, the sense of *removal* growing out of the sense of upward movement, as seen in compounds of *ava*, § 9, has its counterpart in *ad-im-* 'take up and so take away' (comp. *aν-aιρε-*), *ad-aresc-* 'dry up' (intrans.), *ad-bib-* 'drink up.'

With the class of ava- $\mu$ 10 $\gamma$ -, ava- $\phi$ 1 $\nu$  $\rho$ -, I unite admisce-, as also assicca- already quoted.

To the lists already given I am not sure but that I

¹ This adole- is virtually one with adolesc-, the root-syllable of being only a variety of al of alere. In both the notion of 'upward' prevails, only in adole- we have that special sense which occurs in the familiar al-ere flammam. Ard-ere and ard-uus, of the same stock, also unite the two meanings.

ought to add many others. Thus ad-i-, aggredi- (r.), ad-equita-, accurr-, acced-, acci- invite me as it were to the translations, 'go up, march up, run up, ride up, step up to any one, call up; at any rate, these phrases are quite in agreement with the idiom of our own language. Again, admin-iculum 'a prop,' seems to imply a verb ad-min- 'prop up;' and ad-juva- in its preposition claims affinity with ava, partly because verbs of assistance are very apt to appear with a preposition signifying up, as sub-leva-, sub-veni-, succurr-, subsid-ium, and partly because the simple verb juva- seems in itself to have had for its first sense 'to lift or elevate,' which will at once explain its double power 'to delight' and 'to assist.' I think, nay, I suspect the root to be identical with that of the verb lev-a- and adj. levi-, and our own lift, for an initial j in Latin raises the suspicion of a lost l; thus jecur and  $\dot{\eta}\pi\alpha\rho$  are brought into connexion with our liver, jocus with our laugh. The close connexion between l and the y sound (of the Latin i) is well seen in the 'l' mouillé of the French.

I am fully aware that some of the compounds with ad to which I have laid claim might admit of an explanation from the power of the ordinary preposition ad. Thus the first element in acclivis might have been justified by the prefix of the Greek  $\pi\rho\sigma\sigma$ -avtys. Yet in many instances this preposition ad fails utterly, while the senses of ava are all-sufficient, so that I still adhere to what I have said, the doubtful instances receiving a borrowed light from the non-doubtful.

With all this I in no way deny that ad 'to or near' has contributed its compounds to the Latin language,

so that it may often be difficult to adjudicate between the conflicting claims of the prepositions; and at times a just judgment will perhaps make a division between the two rivals, assigning some uses of the same word to the one, some to the other, as in the case of acced. Or possibly the ad = ava may have been at first the only prefix admitted to composition with verbs, and subsequently compelled to submit to invasion of its domain, when the Roman, no longer alive to the sense of up, may have allowed himself to be unduly biassed by the meanings of the familiar preposition ad 'to.' Be this as it may, there will be seen in the sequel not a few instances of independent prefixes sinking into an identity of form.

I proceed to yet another variety. It is a peculiarity of Latin notation that it often prefers a weak vowel to the stronger vowels of other languages. Thus, to the Greek ομβρο- and δακτυλο- stand opposed the Latin imberi- and digitulo-, to the Sanskrit agni- the Latin igni-; and again the Latin sine and lingua are represented in French by sans and langue. But the most valuable instance for the present question is that of the so-called privative particle  $a\nu$  of Greek = in of Latin. It will presently be seen too, that the preposition ara takes in German a form in which the first a gives place to i or e. Am I not justified then in expressing a suspicion that the Romans in such distributival phrases as in-dies, in-horas, &c., employed a preposition in = ava? But the present dealings are rather with compound verbs, and here I first throw together—intumesc- 'swell up,' ingrandesc- 'grow up,' incresc- 'grow up,' inhorre- 'bristle up,' institu- 'set up, insurg- 'rise up,' innutri- 'bring up by nursing,' infla- 'puff up,' incita- 'rouse up,' incandesc- 'blaze up,' inardesc- 'blaze up,' incend-, inflamma- 'set on fire,' indaga-, investiga- 'trace up to the sources;' to which we should probably add the adjective or rather participle insolenti- 'swelling up with pride,' from a lost verb sole- 'swell,' so that it corresponds to the German participle anschwellend.

Then with the notion of back: in-hibe- 'hold up or back =  $a\nu\text{-}e\chi\text{-}$ , and in-flect- 'bend back.'

For 'again' I find two clear cases: in-staura- = re-staura- and in-gemina- 'redouble.'

But the most striking use of ava is in the sense of 'reversing.' Now the Latin inconcilia- in some current dictionaries is said to have the two somewhat opposite meanings of 'to win over to one's side, to conciliate,' and 'to make an enemy of.' Concilia- also is for the most part mis-explained. But Forcellini had already given the right view as to both these verbs. Thus of concilia- he says: 'Verbum est fullonum,' quoting Varro, 'Vestimentum apud fullonem cum cogitur conciliari dicitur;' and supporting this view by Scaliger's derivation of the word, 'a ciliis, h. e. pilis.' The word in fact means to felt cloth, as we still do in making drugget or wide-awakes. The metaphorical use of the word in the sense of promoting the union of friendship is sufficiently intelligible; and of course inconcilio is correctly explained in the same work: 'Contrariam significationem habet τφ concilio;' in other words it means (to invent a new verb) 'to unfelt (cloth),' or separate again the woolly fibres which had been previously united in the process of felting. Thus we have a most expressive metaphor, somewhat like our own 'unravelling,' and available generally for

the idea of breaking up, dissolving, what had been closely united. The word occurs in at least four passages of Plautus, and in all this idea is most appropriate, due allowance being made for this comic poet's love of bold metaphors. The process of felting is no longer carried on under our eyes, as it was under the eyes of Romans in the age of Plautus; we shall therefore have a more intelligible, yet at the same time equivalent metaphor, if we use in its place the phrase 'to make oakum' of him or it, 'to tear to rags.' In the Trinummus i. 2, 99, and the Mostellaria iii. 1, 85, the accompanying accusatives are persons, and the idea is breaking them up as regards their property. In the Baccides iii. 6, 22—inconciliare copias omnis meas—the idea is substantially the same; and in the Persa v. 2, 53, non inconciliat quom te emo may be rendered by 'he does not tear up,' that is 'annul my purchase of you,' quom in the older writers often having the power of quod. C. O. Müller indeed, in his edition of Festus, v. inconciliasti, finds an objection to the doctrine that this verb is the opposite of 'concilia-' in that the prefix in, which denotes negation (abnuitionem), is never attached to verbs, except in the participial form. This difficulty vanishes so soon as we make the in, not the negative prefix, but a variety of ava.

A second example is *i-gnosc-* (for *in-gnosc*) 'unknow,' to invent another word, that is 'forget,' from which the idea of 'forgive' readily flows.

Insimula- is on all sides maltreated. But all will be smooth if we start from simula-re- 'to make one-self like (what one is not),' or 'put on a mask;' for

then insimula-re is 'to unmask (a rogue),' 'to expose him,' that is 'to accuse.'

Infitias ire is in the lexicons translated 'to deny;' but the incorrectness of this is at once seen in the Plautian phrase, 'neque nego neque infitias eo.' But if we derive this substantive from a theoretic infari, 'to unsay,' i.e. 'to eat one's words,' 'to retract what one has already admitted,' the sentence in Plautus has a meaning.

For the idea of opening I offer in-ara- 'plough up,' in-find- 'cleave open,' 'plough up;' and for 'beginning,' not only in-cipi- 'take up,' 'begin' (and perhaps in-coha-), but also in-calesc- 'begin to get hot,' and in-tepesc- 'begin to get warm.' And here I come across some verbs the meaning of which deserves consideration. In Forcellini there is a mixture of what is sound with what is unsound, yet even in this latter case his articles supply the data for safe conclusions. In informa-re he is wholly right; and yet recent dictionaries wholly wrong. Thus his words run: 'Primam et rudem alicui rei formam induco; and under informatus his first quotation is: 'His informatum manibus iam parte polita fulmen erat' (Aen. viii. 426), while Furlanetto in his edition of the great lexicon adds: 'Varr.' (Verr. is a misprint) 'ap. Gell. iii. 10: Quarta hebdomade caput (of a male foetus) et spina quae est in dorso, informatur.'

As to *imbuo*, what appears to me to be the correct starting-point is what we read near the end of Forcellini's article: 'Re intacta adhuc uti incipere.' But the word is probably only a Latin variety of the Greek αναδευ-ω, or in another dialect ανδευ-ω. At any rate 'imbue' is the translation given by Liddell and Scott for the one passage which they quote. The change of

consonants is parallel to what is seen between the German lende 'loins,' and Latin lumbi; and again between the Italian anda-re and the Latin diminutival verb ambula-re. I would therefore translate imbu-'wet for the first time;' and it may have got its metaphorical meanings from the military idea of wetting a hitherto maiden sword in the enemy's blood. Those who translate imbutus 'steeped in,' 'thoroughly imbued with,' wholly mistake the power of the word as understood by Cicero and Catullus.

The verbs *imminu* and *impell*- are usually treated as though the preposition were superfluous. But here we should give a preference to the translation 'begin to impair,' *i.e.* 'impair what was previously entire,' and 'begin to drive,' or, in other words, 'give to that which has hitherto been quite firm its first movement,' 'start' it.

The notion of 'removal,' 'away,' is to be seen in the verb *incid*- in the sense of 'cut off,' which will thus be a different word from *incid*- 'cut into,' and in *infring*- 'break off,' *intabesc*- 'melt away.'

In dealing with the Celtic languages, I shall be very brief. The Welsh has a representative of ava in its inseparable prefix ad-signifying 'back,' 'again,' 'reversal of an act.' Thus from nofio 'to swim,' brynu 'to buy,' nabod 'to know,' gwna 'to do,' and gwisg sb. 'dress,' there are compounds ad-nofio 'to swim back,' ad-brynu 'to redeem,' ad-nabod 'to recognise,' ad-gwneud 'to undo,' ad-wisg sb. 'undress, disarray.' Of verbs alone compounded with this ad there exist above one hundred and seventy.

The Gaelic form corresponding to the Welsh adis commonly ath-, sometimes as-. Thus  $sn\grave{a}mh$  'to

swim, ath-shnàmh 'to swim back; buail 'to strike,' ath-bhuail 'to strike back or again; loisg 'to burn,' ath-loisg 'to burn again, burn deeply; obair 'work,' ath-obair 'work done over again; casta or caiste 'twisted,' ath-chasta 'strongly twisted; beum 'a wound,' ath-bheum 'a second wound; ainm 'a name,' ath-ainm 'a surname or nickname; eirigh 'rising,' ais-eirigh 'resurrection.'

In the Breton the particle takes the shape of ador as-, as ober 'faire' (I quote from Legonidec), adober 'refaire;' kouéza 'choir, tomber,' as-kouéza 'retomber.' But even ana- in its fullest form has left its trace in this language. The verb ana-out has also the dialectic varieties ana-vout and ana-vezout, and is in fact a compound of the simple verb qouzout. These verbs are of great irregularity, gouzout in particular changing the radical syllable gouz to gwez or gwi when the following syllable has one of the weak vowels (i or e). But the relation of the two verbs to each other becomes indisputable, when we place some of the tenses, as for example the futures, alongside of each other:—qwez-inn 'je saurai,' qwez-i 'tu sauras,' &c. ana-vez¹-inn 'je connaîtrai,' ana-vez-i 'tu connaîtras,' &c. I take this from the grammar of Legonidec; in his dictionary the verb is also translated, and perhaps more correctly, reconnaître. This example is the more interesting, because not merely is the prefix identical with the Greek ava, but the root of the verb also is but a variety in form of the Greek root Fig or Fiδ- as seen in ισημι οίδα, the Latin vid- of

<sup>&</sup>lt;sup>1</sup> This loss of a g is but an instance of a general law in the Celtic languages. See another example in ad-wisg from gwisg, a few lines above.

vide-, and our own wis- or wot-, whence wisdom, wise, wit, and the obsolete verb wit or wot. It is also worth while to note, that in the ordinary form anaout, all trace of the root syllable has vanished, just as, to quote an example of Bopp's, is the case with the German im for in dem, where we have a remnant of the preposition, and a remnant of the case-suffix, but not a particle of the pronoun signifying 'the.' We also find in the Breton, both kouna 'to remember' and an-kouna 'to forget,' where, besides the original form of the prefix, we have in its signification what reminds us of one of the most important uses of ava, the reversal of an act.

In Irish there are some three or four prefixes which have a claim more or less certain to represent ava. 1. ath-, as cruinnighim 'I collect,' ath-chruinnighim 'I collect again; 'rioghaim 'I rule,' aith-rioghaim 'I dethrone.'-2. adh-, as molaim 'I praise,' adh-mholaim 'I praise warmly.'—3. an-1, which unites the two very different powers of intensity and reversal: sgairtim 'I cry out,' an-sgairtim 'I cry out loudly;' glearaim 'I follow' (sequor), ain-ghlearaim 'I pursue' (insequor); aithnim 'I know' (ich kenne), an-aithnim ('ich kenne nicht,' says Leo, perhaps rather 'I forget'); icim 'I help,' ain-icim 'I help zealously;' and a verb of the same form icim 'I count or reckon,' ain-icim 'I pass over in counting, I save.'—4. amh-, 'which negatives (or rather reverses) like the German un-,' as garaim 'I gladden,' amh-garaim 'I torture;' réidhim 'I arrange,' amh-réidhim 'I disarrange,'

<sup>&</sup>lt;sup>1</sup> Leo sees in this the Latin prefix in; but his criticism is damaged by his treating the preposition in and the privative in as one word.—Ferienschriften, 1852.

I cannot leave this part of the subject without drawing attention to the light which some of these Celtic examples throw on the Latin ignosc-. It is a common practice, I believe, to consider the prefix in this verb as being the privative in. But to this there is the all but insuperable bar that this negative prefix is attached solely to adjectives and participles. apparent exception ignora-re is none, as it is immediately formed from the adjective ignaro-. But if in- of ignosc- represents the Greek ava with the sense of reversal, we have what we desire, 'forget,' which readily takes the sense of 'forgive;' and now the Celtic languages confirm this view by the Breton ankouna 'to forget,' and the Irish an-aithnim. Nor is it a grave objection that I am here assigning an identity of origin to words so different in meaning as ignoscand agnosc-. For example, ανα-σκευαζ- commonly means 'to dismantle,' but in Strabo and Dioscorides 'to build again or to repair;' αν-ειλε- 'roll up' in Thuc. and Arist., but 'unroll' in Plut.; av-oikig- 'rebuild' Paus., 'restore to (his) home' Strab., but 'cause to leave a home' Aristoph. The only difference between these cases and that of agnosc- and ignosc- is, that the Romans very wisely availed themselves of the variety in form to mark the variety in meaning.

In the Teutonic family I shall first note that the form an- was preserved for a while in one verb of old English, viz. anhang, as in Chaucer's 'Doctoures Tale' (v. 12,193 of Tyrwhitt's ed.)—

'He had to take him and anhang him fast.'

See also Coleridge's Glossarial Index.

So again in modern German we must distinguish

from the compounds with an- 'to,' those in which the notion of commencement resides. Of these, to place the meaning beyond doubt, I quote thirty, and might quote perhaps twice as many:—an-bahnen 'to break a path; an-beissen 'to bite the first piece; an-blasen 'to blow the first note;' an-bohren 'to broach;' anbrennen 'to begin to burn;' an-brüten 'to begin to hatch; an-faulen 'to begin to rot; an-feilen 'to begin to file; an-geben 'to begin to give; an-hacken 'to begin to hack;' an-hauen 'to begin to cut;' anhetzen 'to begin hunting;' an-jagen 'to begin to chase; an-klingen 'to begin to sound; an-laufen 'to begin to run; an-pflügen 'to begin ploughing; anplatzen 'to begin to crack;' an-raspeln 'to begin to rasp; an-reissen 'to begin to tear; an-reiten 'to ride for the first time; an-rennen 'to start; an-säen 'to begin to sow; 'an-sägen 'to begin to saw; 'an-saugen 'to begin to suck;' an-schaben 'to begin to scrape;' an-schälen 'to begin to peel;' an-scharren 'to begin to rake; 'an-scheren 'to begin to shave; 'an-schiessen (eine flinte) 'to try (a gun); 'an-schmelzen 'to begin to melt.

Still more complete is the similarity of the Gothic ana-kunnan, 'to read,' which thus preserves one of the meanings of the Greek avayiyvwok; and of ana-kumbj-an in the sense of lying on a dinner-couch, so that the word is one in meaning with the Greek avakeiµai, and the Latin accumbo. But not rarely this language follows its habit of adding to the n an excrescent d, so as to produce the forms anda, and, or und in place of ana and an; and indeed even within the limits of the Greek language we find the preposition ava itself taking a  $\delta$ . As from the adverb

aιψα 'quick,' comes an adjective aιψηρο- 'quick,' so from aνα 'up,' the adjective aνδηρο- 'raised,' whence aνδηρον, 'a raised bank, dyke, or levée beside a river or canal.' This derivation seems more satisfactory than those proposed from the verbs aναδεω or aνθεω.

In old German a t is preferred to a d; and besides this we find a substitution of weak vowels for the a, as in ind-, more commonly int, sometimes in; but old Saxon ant, middle German ent or en, modern German ent, Dutch ont, old Frisian ond, ont, on, as well as and, ant, und; Danish and Swedish und. Lastly, in Anglo-Saxon we find, what might be expected in a language to which a great variety of immigrants contributed, not only on but or, at, and ed. The evidence about to be given is drawn chiefly from Grimm; but it is right to observe that this scholar connects these prefixes for the most part with the Greek avti (not ava), moved thereto in some measure by the appearance of the d or t in so many of the forms. But this seems to be a very insufficient basis for his argument; and the meanings of ava are far more suitable in the cases where both afford a tolerably satisfactory explanation, while in many the notion of avti utterly fails. Thus we find the Gothie anda-baúht-s, 'ransom,' anda-set-s, German 'ent-setzlich,' andastathiis, 'adversary;' and-bindan, 'ent-binden,' 'unbind, and-hamon, 'ent-kleiden,' and-huljan = 'enthüllen, and-hruskan = 'unter-suchen,' and-kvithan  $(kvith = our \, quoth)$ , 'ent-sagen,' and-letnan, 'ent-lassen werden, and-standan, 'resist,' and-thaggkjan sik. 'ent-sinnen sich,' and-vasjan, 'ent-kleiden.'

Having thus paid the Gothic, what is due to it as the oldest record of the Teutonic languages, the compliment of a separate consideration, I proceed to the allied dialects; but for brevity will mass the evidence, taking for my guidance the series of meanings; and in the quotations I shall not unfrequently attach the Latin equivalent as supplied by Grimm.

- 1. The idea of 'up' is visible in Old Germ. int-habên, 'sustinere, suffulcire,' int-hefan 'sustentare,' in-rihten 'erigere,' in-blâhan 'inflari (be puffed up), turgere;' Old Sax. ant-hebbian 'sustinere;' Ang.-Sax. on-blâvan 'inflare,' on-hebban 'elevare,' on-hrêran 'incitare (rouse up),' on-standan 'adstare (stand up),' on-stellan 'incitare,' on-vacan 'expergisci (wake up);' Mid. Germ. ent-haben 'sustinere,' ent-springen 'oriri,' ent-wërfen = 'aufstreben;' Mod. Germ. ent-stehen 'arise, originate,' &c.
- 2. As we found among the Greek compounds with ava many verbs of 'flaming up or taking fire,' so also here we have Old Germ. in-liuhtan 'illuminare,' in-prëhtan 'illucescere,' int-prennan 'accendere,' in-prinnan 'exardescere,' in-scînan 'illustrare,' in-zundan 'incendere;' Mid. Germ. en-blæzen and en-brennen 'accendere,' en-brinnen 'accender,' en-pfengen 'accendere;' Ang.-Sax. on-älan 'accendere,' on-bernan 'accendere,' on-tyndan 'accendere;' Mod. Germ. ent-flammen, ent-glimmen, ent-zünden, &c.
- 3. But if the two classes, which have just been given, repudiate all connexion with  $a\nu\tau\iota$ , and favour the cause of  $a\nu a$ , still stronger evidence in support of  $a\nu a$  is found in the extensive series of words, where the prefix carries with it the peculiar power of 'reversing' the action of the simple verb. An enumeration would be idle. The verbs of this class constitute the great bulk of Grimm's third division, yet he has

given but a small fraction of the whole, for the Modern German contains a full hundred examples of such compounds with ent-, the Dutch lexicons contain at least a hundred and fifty such compounds with ont-; and our own language might furnish a rich supply, as untie, unbind, unloose, &c. In confirmation of the view that this sense of reversing a previous act naturally associates itself with the idea of 'up,' I may observe that the German and Swedish languages at times avail themselves of the prepositions, which in form as well as in sense correspond to our own up, in the formation of such verbs, for example, auf-decken and upp-täcka 'to uncover,' auf-lösen and upp-lösa 'to unloose.'

I may here be permitted to draw attention to a prevalent error among our own writers on grammar, who assume, it must be confessed very naturally, that unas used before verbs (unbind, &c.) is identical with un- as used before adjectives and participles (unwise, unseen). Grimm has carefully noticed the distinction (p. 816); but the error still stands in Thorpe's translation of Rask's Ang.-Sax. Grammar and elsewhere. The evidence to the fact that the prefix un in verbs and the prefix un in adjectives and perfect participles are wholly unconnected, consists of two parts. In the first place the meanings differ. The un before adjectives is, for the most part,1 a simple unqualified nega-Thus unwise, unseen, are no more and no less than 'not wise,' 'not seen;' the Latin indicta caussa is 'caussa non dicta.' On the other hand, to unfix is a positive act; the loosening of that which was previously fixed. Had the English language possessed

<sup>&</sup>lt;sup>1</sup> See, however, the paper on  $\alpha\nu$  'not.'

the verb to unknow, like the Latin ignosc-ere and the Breton an-kouna, 'not to know' would have been a mistranslation; it should have been 'to forget,' a word of different import; for although he who forgets is now in the position of one who does not know, yet the expression carries with it a distinct reference to a knowledge once possessed. Still more clearly does the difference in the power of the prefix come out, when we regard such verbs as unloosen, ανατηκείν, which cannot for a moment be held to be equivalents for 'not to loosen,' 'not to melt.' At the same time it is true that now and then the two prefixes may lead to a common result. Thus our own to unman is a pretty correct translation of ανανδρο-ειν, and yet this Greek verb is derived from the adjective  $a\nu-a\nu\delta\rho$ -o- 'unmanly.' So much for the distinction of sense. The difference of form is best seen in a table:

Eng. un before adj. =

Greck. Welsh. Goth. Old Sax. Old Germ. Germ. Ang.-Sax. Dutch. Dan. Swed. αν | an | un | un | un | un | on | u | o.

Eng. un before verbs =

ava | ad | and | and | int | ent | on | ont | und | und. Thus English and Latin stand almost alone in confounding the two prefixes under an identity of form.

4. In p. 813 Grimm dwells at some length on the fact, that the compounds with our prefix often denote an incipient sense, as Germ. ent-schlafen 'to fall asleep,' Ang.-Sax. on-drædan 'to shudder.' This sense, peculiar as it is, was marked in the compounds of ava (§ 7). To this division of course belong the large family of German compounds with an-, of which I have already given abundant instances (p. 23).

- 5. The notion of 'escaping, driving back or off, away,' is also common to ava and the Teutonic prefixes. Thus I find in Grimm's list: Old Germ. int-lâzan, Ang.-Sax. on-lætan 'to let off,' Old Germ. int-cân 'evadere,' ind-rinnan 'effugere,' int-slîfen 'elabi,' in-slingen 'evadere,' int-sagên and int-rahhôn 'excusare,' int-fallan 'elabi,' in-pharan 'dilabi,' in-fliohan 'effugere;' and the list might easily be extended from existing German languages.
- 6. 'Opening' is a sense found in: Old Germ. in-brëstan 'rumpi,' in-kinnan 'aperire,' in-geinen 'findere.'
- 7. For 'again,' the evidence of the Ang.-Sax. on-cnâvan 'know again, recognise,' would be most valuable even if it stood alone; but the already quoted Gothic and-thaggkjan, translated by Grimm 'cognoscere,' Old Sax. ant-kennjan, translated by him 'intelligere,' should probably go with it; and at any rate the modern German ent-sinnen sich 'remind oneself, remember.'
- 8. And this brings me to a special consideration of other verbs which Grimm translates by 'intelligere.' The notion of mental perception is very commonly expressed in language by words which when analysed literally signify 'take up.' Thus we often hear such a phrase as: 'Did you pick up anything at the lecture?' for those who unite attention to fair ability, seize what they hear, and make it their own, while the stupid or inattentive let the words fall unnoticed. Hence the Latin phrase non me praeterit, 'it does not escape me.' So again the Scotch have the expression gleg at the uptake for 'quick of apprehension.' The word which has just been written shows

that the Latin apprehendere was with reason included in the list where ara simulates the form of ad, the more so as this interpretation equally suits that other use of apprehendere, viz. 'to take up or apprehend in the sense of arresting a prisoner; and of course with apprehendere must go the French verb apprendre 'to learn.' To this head belong also the Old Germ. in-këzan 'cognoscere,' and its representative the Ang.-Sax. on-gëtan or on-gitan, 'intelligere,' with its subst. and-gët or and-git 'intellectus,' and adj. andgitol 'intelligibilis.' As for the Gothic verb and-standan 'resistere,' Old Sax. and-standan 'intelligere,' Old Germ. in-stantan 'intelligere,' Modern Germ. ent-stehen 'arise,' various as their powers are, they all admit of satisfactory explanation if we start from the notion of 'standing up.' To stand up in spite of difficulties well calculated to weigh down the weak, or in other words 'not to succumb,' is a notion which the Gothic and-standan shares with the Latin sub-sistere. The same metaphor applied to the mind gives us the idea, 'to be equal to a mental task, parem esse negotiis, to be strong enough for one's place, to understand one's work.' Lastly, the German ent-stehen, Dutch ontstaan 'to arise,' express the action, not the mere state of 'standing up.'

9. The verbs which carry with them the idea of 'beginning or undertaking' have frequently an identical origin with that which in the last paragraph was assigned to verbs of perception. 'To take a thing up,' to take a thing in hand,' are phrases with ourselves for 'beginning;' and 'to take a thing upon one,' means 'to take the responsibility of an undertaking.'

The Latin suscipere acquires its notion of 'undertaking' in this way, and hence it is well calculated to translate so many of the compounds in Grimm's list: Goth. and-niman 'suscipere,' Old Germ. en-nëman, Old Germ. int-fâhan,¹ Old Sax. ant-fâhan 'suscipere,' corresponding to Ang.-Sax. on-fangan or contracted on-fon 'undertake,' Germ. an-fangen 'to begin,' Old Germ. in-kinnan, Ang.-Sax. on-ginnan² 'incipere.'

I may here observe that Grimm seems to have included in his lists not a few verbs which belong to compounds with an 'on' or 'to,' and its representatives, especially in the Ang.-Sax. series, as on-clif jan 'adhaerere,' on-fëallan 'incidere,' on-irnan 'incurrere,' on-settan 'imponere.' On the other hand, by a most unsatisfactory compensation, in his list of compounds with the Gothic ana = our on, there are some which must be claimed as compounds with ana = ava 'up,' viz: ana-fang 'initium,' ana-saga 'objectio.'

In dealing with the German compounds I have passed over three which have an initial emp- before an f, emp-fehlen, emp-fangen, emp-finden. In the first we have a deceitful form, corrupted, as it seems to me, from an-befehlen 'to recommend to.' The argument for this lies in the Dutch and Danish forms of the word, viz. aan-bevelen and an-bevale. But in the others, emp- is but a modification of ent, caused by the following lip-letter. The Old Germ. int-fâhan 'suscipere,' and int-findan 'sentire,' give bail for emp-fangen and emp-finden; and the precise meaning of the latter was probably 'all at once to become sensible of,' for

<sup>&</sup>lt;sup>1</sup> Suspicere is merely a misprint in Grimm.

<sup>&</sup>lt;sup>2</sup> Ginnan, the simple verb, is obsolete. Grimm holds that its sense must have been 'capere, complecti' (p. 811).

'to feel' is an older meaning of the verb finden than 'to find,' in our English sense. The Scotch indeed still possess the verb with this power. 'You don't mind what I say,' says the angry mother to her boy; and giving him a smart box on the ear, she adds, 'D'ye find that.' It is easy to see how from the idea of feeling that of discovery or finding would arise.

As regards the Anglo-Saxon, the quotations in which the senses of 'again' and 'away' have entered, have been few. I might indeed make some addition to the list, and still more would it be easy to add to those in which the idea of 'up' appears; but after all, the sense of 'reversing a previous act' is the one which the prefix on = ava usually carries with it. This onesidedness in the Anglo-Saxon preposition seems to admit of the following explanation. When a word has established itself in several dialectic varieties of form, it is a great convenience to distribute any varieties of meaning which may belong to the parent word between them; and thus a dissolution of partnership as it were takes place, each dialectic variety commencing business on its own account with its own separate stock. In this way the Greek ava, I have said, is represented in Anglo-Saxon by four particles, on- which we have already seen, ov-, et-, and ed-. Rask, in his Grammar (§ 33), has noticed the peculiarity in this language by which the aspirate  $\mathfrak{F}$  supplants the nasal sounds nn and nd. is probably on this principle that we must account for the appearance of the suffix as in the plural of the present indicative and imperative, while in the other

See also Jamieson's Dictionary.

tenses we have the suffix en or on (Rask's Gr. Trans. p. 88). I therefore readily assent to this writer (p. 99) and to Dr. Bosworth (sub voce), when they tell us that og-1 represents the German ent- 'away, from,' as o\*-fleón = ent-fliehen 'flee away,' od-gangan = entgehen 'escape,' ov-sagan = ent-sagen 'renounce,' ovfeallan = ent-fallen 'fall away.' But in lieu of this ox- we also find at- as a prefix of the same power, and probably but a dialectic variety, for the term Anglo-Saxon seems to have been applied somewhat vaguely to all the variety of Saxon dialects that were spoken in this island in early times, although the immigrants were supplied from all the coasts between Norway and the Zuyder Zee. In the present case there is the awkward fact that the language also possessed a preposition at = ' to.' Dr. Bosworth indeed regards the two particles as but one, and would explain the change of meaning from the idea of 'to' to that of 'from,' on the principle that 'you approach a person or thing, when you wish to take something away.' This seems unsatisfactory. Examples of at- signifying 'away,' are at-fleogan = ent-fliegen 'fly away;' at-hleogan = ent-laufen 'run away;' æt-sacan = ent-sagen 're-

<sup>1</sup> Oδ- seems to be a corruption of some such syllable as unδ- or und- (compare the Ang-Sax. toδ 'tooth,' and the Gothic tunthus, Grimm, ii. 907, muδ 'mouth,' and Germ. mund); and æt- perhaps represents immediately the German ent-, the long vowel compensating for the disappearance of the liquid. But still ultimately all the four little particles are of one origin. As Grimm would distinguish between the Gothic prefixes and- and und-, so again, in p. 715, he warns his reader against confounding the Ang.-Sax. on- and oδ-; yet he himself identifies the Ang.-Sax. on- with the Germ. ent-; and the examples above given are surely sufficient to identify oδ- with ent-.

nounce.' On the other hand, the form ed- is reserved for the sense of 'again,' as ed-nivian 'to renew,' edleán 'to recompense,' ed-cenning 'regeneration.' Here we have, as Rask has remarked, a representative of the Kymric or Welsh ad-. Indeed it may be assumed that the form ad- or ed- in the sense of 'again,' parted company from the other representatives of ava at an early stage of the Indo-European language, so that it appears with little variety of form in the Latin, Welsh, and Anglo-Saxon. In the Old German too it has its distinct representative, though with more considerable change, in ita or it (Grimm, p. 757), the vowel being such as the above-quoted int- for and- and ent- would have suggested, and the tenuis t also, as usual in that dialect, superseding a medial. It will subsequently be seen that derivatives from this ad- or ed- again hold themselves somewhat aloof from the other representatives of ava.

But I am strongly impressed with the belief that the Anglo-Saxon possesses yet another variety of our prefix, viz. a- as a corruption of on-, and this the more because we find in our modern language instances where our ordinary preposition on has been reduced to this vowel, as a-foot, a-board, for on foot, on board. The adverb a-long, when compared to the Germ. ent-lang and Ang.-Sax. ant-lang, is even a stronger instance of such corruption; but I would rather rely on a perusal of the following verbs, which are but a selection from many instances of a similar kind in Dr. Bosworth's Dictionary.

1. Up: a-hebban 'lift up,' a-hreran 'raise up,' a-springan 'spring up,' a-timbrian 'erect a building,' a-weallan 'bubble up,' a-wacan 'awake,' a-lichtan 'enlighten,' a-tendan 'set on fire.'

2. Back: a-bugan 'redeem,' a-cerran 'return,' a-cwesan 'answer,' a-gefan 'give back,' a-gildan 'repay.'

3. Again: a-cucian 'revive,' a-gitan 'know' ('re-

cognise?').

- 4. Reversal of what the following word denotes, un: a-firan 'emasculate,' a-leósian 'dismember,' a-scealian 'shell' (i.e. 'unshell'), a-mansumian 'unmarry.'
- 5. Reversal of a previous act, un-: a-lysan 'let loose' ('unloose?'), a-slackian 'slacken,' a-barian 'make bare,' a-falian 'putrefy.'

6. Beginning: a-ginnan 'begin.'

7. Removal, away: a-cærran 'avert,' a-drifan 'drive away,' a-faran 'depart,' a-ládean 'excuse.'

Before I leave this branch of our subject, I may observe that, as Grimm led me to expect, our particle has been found to run through the whole gamut of vowels, Goth. and-, Old Germ. int-, Modern Germ. ent-, Dutch ont-, Danish und-. We have also seen it written with a single nasal consonant, Greek ava and German an- (an-fang, &c.), Old Germ. in-, Mid. Germ. en-, Ang.-Sax. on-, and Eng. un-. Further, we have seen it reduced to a mere a- in Anglo-Saxon; and our language has still examples in a-wake and acknowledge, to say nothing of Shakspere's acknow in the same sense. Lastly, our verb e-lope = Germ. ent-laufen, or Dutch ont-loopen 'run off,' brings us to the extreme case of a toneless e.

I proceed to call a fresh batch of witnesses. It is well known that prepositions are fond of assuming a certain suffix which has in great measure the form and probably the meaning of the comparatival suffix. Thus the Latin sub, prae, prope, have secondary forms

super, praeter, and propter. Our own aft and nigh lead to after and near, the Gothic uf and nih to ufar and nidar, the Old Germ. ur (= Goth. us) and bit (= our with) to azar and widar. It is on this principle that Grimm is disposed to deduce from the prefix and- a theoretic and ar- (p. 716), which, though not producible in Gothic, he holds to be represented by the Old Norse endr- (for endir-). While he thus connects the prefix endr- with the family of the Gothic and-, he seems to regard the prefix undr-(p. 914) as one no way related to it. But I feel compelled to claim undr- as more nearly akin to andthan endr- itself, holding the former to be the full equivalent of Grimm's theoretic andar-, while endrappears to me to be for the Old Norse the comparatival form of the simple prefix ed- 'again,' so familiar on Ang.-Sax. ground. It is not a very strange matter that languages should be capricious in their use of these particles, especially as the comparatival form differs little, if at all, in practical use from the simple particle. Thus the Romans abstain from using ad 'again' as an adverb, employing for this object the secondary form iterum (comp. the Old Germ. it or ita 'again'). A final medial in Latin was probably pronounced as a tenuis (comp. ab, ob, sub, with the Greek  $a\pi o$ ,  $v\pi o$ ,  $\epsilon \pi \iota$ ; and with the derivatives from sub itself). Hence ad was probably spoken as at, so that iterum is entitled to a t. Again, the Ang.-Saxon has a simple prefix ed- 'again,' but seems to have avoided the formation of a comparative. On the other hand, the Norse endr-, Danish atter, Swedish ater, all signifying 'again,' have at home no positive to which they may be referred. But while the words

just enumerated all agree in the limitation of their power to the one idea of 'again,' undr- gives to the verbs connected with it meanings of various kinds, but amid that variety only such as will flow from the idea of 'up;' indeed, one half of them are by Grimm himself regarded as equivalents of Latin compounds with sub.

But the prefix undr-, or, as Haldorson writes it, undir-, seems to be identical with the Ang.-Sax., Danish, and Swedish under-, as also with the German unter- and Dutch onder-. The forms justify the assumption that they are only comparatival extensions of the prefixes we have been considering in the preceding pages. Thus the Danish and Swedish und-er- stands accurately in the required relation to und-; and nearly so the German unt-er- to ent-, the Dutch ond-er- to ont-; and even the Ang.-Sax. und-er- differs in no intolerable degree from the simple prefix on-. But if the forms be favourable, not less so are the meanings, which the disyllabic prefixes give to verbs in composition. The arguments, if stated at length, would be for the most part a repetition of what has been said in discussing the simple prefixes; and the very variety of powers which will be found to belong to unter-, &c. will only strengthen the position, when it appears that this variety is in nearly every element the counterpart of what has been seen in the compounds with ent-, &c. In the German, unter-halten signifies 'to sustain, to support, to entertain, to keep up,' the last in all the varieties of its use, 'to keep up a friendship, a correspondence, a building, a fire; comp. aν-εχ-. Unternehmen and unter-ziehen 'to undertake,' including

the very word by which I have translated them, possess a meaning which has been already seen and considered in the Gothic and-niman and Old Germ. en-nëman (p. 30). Unter-fangen (sich) 'to take upon oneself, to presume,' is substantially explained in the same place. Unter-stehen (sich) 'to be so bold,' brings to mind what was said of the Gothic andstandan, to which it is immediately related in both elements; and similarly our own under-stand is in agreement with the Old Saxon and-standan and Old Germ. ind-stantan 'intelligere.' Further, we have unter-stützen 'to prop up,' unter-wühlen 'to grub or rummage up' (like a hog), unter-keilen 'to wedge up,' 'raise by wedges;' unter-bauen, unter-mauern, 'to support an object by building a wall, &c. up to it.' Unter-suchen 'to search up to the sources,' has in its prefix the same power that ava has in ava-κριν-, &c.
Unter-richten and unter-weisen, 'to instruct,' may well be classed with the numerous verbs of 'education,' which owe their power largely to the notion of 'up,' as bring up, educate, rear, edify, instruct, train up, instituere, innutrire, alumnus (from al-ere 'to raise'). Another power of the Greek ava and German ent- shows itself in unter-lassen 'to leave off.' The idea thus expressed by the fuller prefix is not far remote from what belongs to the German ent-lassen or Dutch ont-laten 'to let off, to release,' while it precisely agrees with what we see in the Danish und-lade 'to leave off.' Unter-sagen einem etwas 'to forbid, to interdict,' and ent-sagen (einer sache) 'to renounce a thing,' or its equivalent in form, the Ang.-Sax. onsacan 'to refuse,' all agree in expressing a prohibitory injunction, and the prohibitory portion of the idea

must reside in the prefixes. Again, such verbs as unter-arbeiten, -graben, -höhlen, -minen, -spülen, -waschen, speak of an action directed from below, i.e. upwards.

Further, I cannot but attach some little weight to the consideration that the Latin preposition sub, which truly represents our up in both form and sense, forces itself constantly upon us when we translate these German compounds into Latin: nay, it seems probable that a desire to give a literal German equivalent led to the formation of some among the following German verbs from the Latin: unter-drücken= 'supprimere,' unter-werfen = 'subjicere,' unter-jochen = 'subjugare,' unter-schreiben='subscribere,' untersiegeln and unter-zeichnen = 'subsignare,' unter-eitern and unter-schwären = 'suppurare.' Unter-bleiben 'to remain behind, expresses the same notion as the Greek ὑπο-λειπεσθαι and the Latin re-manere, and the prefixes of these two verbs are in agreement with the power of ava. Unter-mischen and unter-mengen I would rather translate by the vernacular, 'to mix up,' than by 'intermix,' for here also is found the idea of upward movement, as in ava-μιση-, ava-φυρ.

But while I have been thus enumerating a long series of German compounds with unter-, I have probably exposed the theory to a suspicion of some weakness, by appearing to ignore that familiar preposition unter-, or, as we English write it, under-, with the sense of 'lower.' But in truth I have not lost sight of this word, nor was it my intention to claim as akin to ava all the instances in which the German vocabulary presents a compound with unter-. In the first place, I resign all claim to those sub-

stantives which are directly formed from a simple substantive by the addition of this prefix, as unterlehrer 'under-teacher,' unter-kleid 'under-garment.' Of the other substantives, I claim only such as are deduced from verbs in which the unter- has already been claimed. It is therefore solely in the region of the verbs that the battle between the rival prefixes must be fought; but, to use a more pacific metaphor, it may be asked, Where is the line of demarcation to be drawn? Now I find a strong confirmation of my theory in the fact, that the compounds which I have been led to claim on the evidence of their meaning alone, turn out to belong, every one of them, to a natural class, and the principle of distinction on which this class is formed had wholly escaped my attention when first making a collection of examples. It is however a familiar fact with German scholars, that the compounds with unter- are divisible into those which have a separable prefix, as unter-gehen 'to go down, sink, perish,' whence ich gehe unter and unter-zu-gehen, and, secondly, those with an inseparable prefix, as unter-sagen 'to interdict,' whence ich unter-sage, never ich sage unter, zu unter-sagen, not unter-zu-sagen. Further, there is an invariable distinction of accent, those with a separable prefix accentuating the prefix itself, únter-gehen 'to go down,' the others as uniformly giving the accent to the verb, unter-sagen. we have two streams of words, which, though they meet in a common bed, do not mix their waters, and by this distinction seem to justify me in referring them to different sources. Now all the verbs which I claim possess the inseparable prefix, with the accent

on the root syllable of the verb; on the other hand, to the separable prefix and its peculiar accent is regularly attached the notion of 'down or under.'
My views as to the origin of this other preposition do not belong to the present subject; and as I have enough upon my hands, I purpose to reserve them for subsequent consideration. It may be observed, however, that the compounds with my own unterseem to be the older occupants of the ground. In the Old Norse, Grimm expresses his belief that undris always inseparable; and at any rate it is not until the period of the Middle German that we meet with a first attempt to import the Latin inter (from in). This was for the purpose of creating a quasi-hybrid formation, which however, in obedience to the law that holds in the physical world under like circumstances, soon died out. I allude to the use of unter as an equivalent to the Latin inter or French entre in the formation of reciprocal verbs, as sich unter-küssen, &c. in evident imitation of the French s'entre-baiser (see Grimm, ii. 878).

The Ang.-Saxon will also yield to my wooing. Here I find the prefixes on- and under- unmistakeably asserting their relationship to each other by the similarity of power which they bring with them to the simple verb. On-gitan is translated by Dr. Bosworth 'to know, perceive, understand,' under-gitan 'to understand, know, perceive;' 2. on-gynnan 'to begin, undertake,' under-gynnan 'to begin;' 3. on-secan 'to inquire,' under-secan 'to seek under, to inquire, to examine;' 4. on-wendan 'to turn upon, &c. over-throw,' under-wendan 'to turn under, to subvert;' 5. on-cerran 'to turn, to turn from, to invert,' under-

cerran 'to turn under, to subvert;' 6. on-fon 'to receive, take,' under-fon 'to undertake.'

Now it is plain from the translations,—'to seek under' in 3, 'to turn upon' and 'turn under' in 4, and 'turn under' in 5,—that the lexicographer was anxious to give in the first place what he deemed a literal translation, and that in his endeavour to effect this object he was biassed by the supposition that the Ang.-Sax. prefixes on- and under- had the power which belongs to the two prepositions so written at the present time. In truth the words subvert and overthrow, for over is but a comparatival form of up, give strong evidence in favour of the power here claimed for the two Ang.-Sax. prefixes; and thus upturn or up-set would have been the simplest translation. 'Under-turn' or 'turn under' are both rejected by the idiom of our language.

In what has been said, it has been more than once assumed that the original meaning of the Latin sub is 'up.' But this will not obtain the ready assent of all scholars. Those whose matured intellect has been more especially devoted to the Greek language,-and this condition applies to the great bulk of classical scholars both in England and Germany,—are very apt to have what I must consider an erroneous bias as to the power of this prefix. Grimm also (iii. p. 253) puts forward views in which I cannot agree. His sections 6 and 8 in that chapter seem to me to require remodelling; and I would put together as equivalent forms, Lat. sub, Greek ὑπο, Go. uf, Old and Mid. Germ. uf, Modern Germ. auf, Old Frisian op or up, Dutch op, Norse and Swedish upp, Eng. up. The Latin sub, as it stands superior to the rest in having

preserved the initial consonant, so also exhibits the true meaning of the word with more clearness than its sister language, the Greek. Its power is well seen when it is employed as a prefix to verbs, and also in Thus we have sub-veh- 'carry up' its derivatives. (see Caesar, B. G. i. 16), sum- (= sub-im-) 'take up' (opposed to dem- 'take down'), sub-duc- 'draw up' (sc. naves, opposed to deduc-), sub-leg- 'gather up,' sub-leva- 'lift up,' sub-sili- 'leap up,' sub-sist- 'stand up, sub-vert- 'up-turn, sub-i- 'ascend, suc-ced- 'go up, suc-cinq- 'gird up,' sub-veni-, succurr- 'come up or run up to a person's support, suc-cuti- 'toss up,' suf-fer- 'bear up, sustain,' suf-ficit the opposite to deficit, suf-fla- 'blow up,' suf-fulci- 'prop up,' sug-ger-'heap up,' sup-ple- 'fill up,' surg- (= sur-rig-) 'rise up, with sub-rig- 'raise up,' sus-cip- 'take up,' suscita- 'rouse up,' sus-pend- 'hang up,' suspic- 'look up, suspira = 'an-hela-', sus-tine- 'hold up,' sus-toll-'raise up,' sursum (= sub-vorsum) 'upward.'

Surely then, so far as sub is concerned, Grimm is not justified in the assertion "that it is merely by the addition of the suffix er (as seen in super) that this preposition obtains its full sense of upward motion."

But let us look to the derivatives from sub and its representatives: as, superi, superior, summus, all of which distinctly denote 'elevation.' So in Greek, to say nothing of  $\mathring{v}\pi \epsilon \rho$ , we have in  $\mathring{v}\pi a \tau o s$ , an epithet of

¹ Yet the following statement has been made: "ὑπατος for ὑπερτατος, like Lat. summus for supremus." Would the supporters of such doctrines regard postumus, primus, μεσατος, πρωτος, as contractions of postremus, priorimus, μεσερτατος, προτερωτατος? Again, when ὑπατη is translated 'the lowest chord or note,' it must be remembered that the names employed in the Greek musical

Jupiter on the one hand, and on the other the ordinary title in Greek writers of the Roman consul. Again, are not ύψος 'height,' and ύψι 'on high,' evidently connected with our preposition? But if these instances be not enough, all the Teutonic languages, with the exception of the Gothic, conspire in supporting our view; for the prepositions uf, auf, op, up and upp in the different branches of this family have a power too distinct and too invariable for any doubt. And even in the Gothic, though Grimm would assign 'under' to the preposition as its primary sense, his own short list of compounds with uf (ii. 902) includes uf-haban 'sustinere' (hold up), uf-brinnan 'exardescere' (blaze up), uf-graban 'suffodere' (dig up), uf-brikan 'reji-.cere, 'uf-kunnan 'cognoscere' (say rather 're-cognoscere'), uf-vôpjan 'exclamare, 'uf-svôgjan 'ingemiscere,' all of which contain senses such as would be suited to compounds of ava, and therefore may well reside in compounds with another preposition signifying 'up.' But if we pass from the Gothic to the Old German, the evidence is of the clearest character. The following eleven verbs make up the entire list of Grimm (p. 897): uf-haben 'supportare,' uf-hefan 'suspendere,' uf-kan 'surgere,' uf-gienc 'exit,' uf-kangit 'adolescit,' uf-purgen 'suscitare;' uf-burren 'attollere;' uf-quëman 'oriri, exoriri;' uf-richten 'erigere;' uf-stantan 'surgere;' uf-stikan 'ascendere, scandere.' Again, the comparatival forms, Lat. super, Gr. ὑπερ, Goth. ufar, Old Germ. upar, ubar, Mod. Germ. über with ober as an inseparable prefix, Old Sax. obar, Old Fris.

terminology are precisely the opposite to ours. Compare  $\nu \epsilon a \tau \eta$  'the highest note,' though the word in itself means lowest.

over or contracted ur, Dutch over, Ang.-Sax. ofer, Eng. over and upper, Old Norse yfir and ofr, Swed. öfver, Dan. over, are not more regular in formation than consistent in sense. Grimm himself admits that they all express the idea of elevation; but if this idea did not already exist in the root, how could its introduction be effected by the comparatival suffix? how could the addition of a syllable signifying 'more' or 'of two' bring about the marvellous metamorphosis of 'down' to 'up?' To admit this would be to admit that after should signify before and nether above; and thus all language would be subverted.

Still there remains a difficulty not to be passed over, in the fact that sub, ὑπο, and the Gothic uf often require the translation 'under.' The explanation I would offer is this, that movement upward is the first sense of sub, &c.; but that when that movement reaches its limit, the body which had been moving 'up' towards a certain object, has attained the position of being 'under' it. Accordingly sub murum ire means 'to go up to the wall,' but sub muro esse 'to be under the wall.' We hang 'up' a chandelier; and the operation over, the chandelier is 'under' the ceiling. It is therefore habitual to find sub denoting 'under' when compounded with verbs of rest, as subiacere, subesse: and if it be also at times found with this sense in verbs of motion, it should be recollected that the mere verbs of 'putting,' though as verbs of motion they should require the accompanying preposition to take an accusative alone, yet often allow the case of rest (abl. in Lat., dat. in Greek) to supplant the case of motion. Thus we find collocare in navi, in cubili, in custodia, where the strict theory of grammar would rather

demand an accusative, in navem, &c. In the same way the syntactical rule which justly admits a dative after verbs compounded with prepositions of rest, as campus interiacet Tiberi ac moenibus Romanis, is extended also to verbs of mere putting, as anatum ova gallinis supponimus; and this with some reason, seeing that the act of putting is momentary, and the mind prefers to dwell on the permanent state of things which follows. Hence we find that submittere, though strictly signifying 'to send up,' as Terra submittit flores, is also used of 'putting under or down,' especially in the perfect participle, where the action is over. Such a practice is well calculated to lead to equivocal results. Thus submissus is 'upraised' in Silius Italicus, 'lowered or low' in Cicero and Caesar. But for the most part the verb which it accompanies by its own nature prevents ambiguity, as submergere.

There is yet another point of view from which we are apt to attribute to *sub* the idea of 'under.' In the various processes of undermining, as by digging, the action of water, &c. the agent is of course below; but on the other hand the action is directed upward, so that *sub* is still in its proper place. A man in a cave may dig downward or upward. It is only in the latter case that the operation can with strict propriety be expressed by *suffodere*, *undermine*, *untergraben*.

In Greek the use of  $\dot{\nu}\pi o$  as 'under' in compounded verbs was carried to the greater excess, because there lay at hand the unambiguous ava to express the notion of 'up.' But even the Greek has distinct traces of the original power of  $\dot{\nu}\pi o$  in compounds, as  $\dot{\nu}\pi o \delta \epsilon \chi o \mu a \iota$  'I take upon myself, undertake,'  $\dot{\nu}\pi \iota \sigma \chi \nu \epsilon o \mu a \iota$  the same,  $\dot{\nu}\pi \epsilon \chi \omega$  'I uphold,'  $\dot{\nu}\pi o \lambda a \mu \beta a \nu \omega$  'I take up, apprehend,'

(ύπολ. ίππον 'pull up a horse,') ύφιστημι 'I support an attack' = subsisto.

Lastly, when we find two meanings as here attached to a word, one of which implies motion, the other rest, it seems generally right to give a preference to the former, seeing that verbs of the shorter form, and for that reason the older, commonly denote action. Indeed, if the mimetic origin of language be admitted, this follows as a necessary consequence.

But to leave this digression. In dealing with the German unterhalten there was given for one of its translations 'to entertain,' a word which in power is nearly equivalent to 'sustain.' As sustenance is connected with the one word, so we have the idea of food implied in the phrase 'good entertainment for man and horse.' Even to entertain in the sense of 'amusing' is to keep up the interest and spirits of friends. Take too the following passage from the "Life of Col. Hutchinson," by his widow (Bohn, 1846, p. 319) :-"Col. Hutchinson's cheerful and constant spirit never anticipated any evil with fear. His prudence wanted not foresight that it might come, yet his faith and courage entertained his hope that God would either prevent it or help him to bear it." But the word entertain belongs to the Norman element of our language, being the representative of the French entretenir and the Italian intertenere. We are thus brought to the Latin domain, and as tenere is the precise equivalent in sense of the German 'halten,' the question arises whether there can be any connexion in blood, as there is undoubtedly much external similarity, between the Latin inter (Fr. entre) and the German prefix unter 'up.' Enter-prise, entre-prise, entre-prendre compared with unter-nehmen suggest the same inquiry, since the verb prendre is identical with the Latin prehendere or prendere. But we have also the poetical emprise, which conducts us in like manner to the Italian noun impresa and verb imprendere 'to undertake.' This verb is the more interesting as it also has the sense 'to learn,' thus giving a double assurance that its prefix is connected with the particle ava 'up.' But besides this, I am led to assume that the Latin language also, some time or other, in some part of Italy, possessed two verbs of nearly equal import, im-prendere and inter-prendere, where we have an exact counterpart in the prefixes to the German ent-nehmen and unter-nehmen.

Invited in this decided manner to the consideration of the Latin compounds with inter, I find among them nearly all the varieties of power which ava and its representatives possess. At the same time the Latin, like the German, has also compounds with a second inter of distinct origin. With this admission I lay claim to the following: Intel-lig- 'to pick or gather up,' and hence 'to perceive:' inter-misce- 'to mix up, and inter-turba- (Plaut., Ter.) 'to stir up' (for the true sense of turba-re is simply 'to stir,' hence turbida aqua 'muddy water'). Inter-iung- (equos, boves) 'unyoke,' is a distinct example of inter in the to us uninteresting sense of reversing an act. As the literal meaning of iungere is rather 'to yoke' than 'to join,' this verb truly represents the German ent-jochen.

Inter-quiesc- (Cato, Cic.) 'rest after labour' = avaπαυ- (r.). Inter-dic- 'forbid,' inter-mina- (r.) (Plaut., Cic.) 'forbid by threats,' may be placed beside entsagen 'to renounce' and unter-sagen 'to forbid, to

interdict;' and with the same we may perhaps class inter-pella-. As the German ent- often signifies 'escaping, disappearance,' so we find inter-mor- 'die off, die out, swoon away' (Cato, Plin., Cels.); interneca- 'kill off so that none are left' (Plaut.); interfring- 'break off' (Cato, 44,1 but not Pliny as an independent authority, for in xvii. 18 or 30 he is only quoting Cato); inter-aresc- (Cic., Vitr.) 'dry up' (comp. ava-ξηραιν-); inter-bib- 'drink up' (Plaut.); inter-mitt-2 'leave off' (comp. unter-lassen, Dutch ont-leten, &c.); inter-rump- 'break off' (comp. unter-brechen); interstingu- (Lucr.) lit. 'stamp out,' 'extinguish;' interter-? 'destroy by rubbing,' a verb not itself producible, but implied in its derivatives inter-tr-igon-, intertr-imento-, inter-tr-itura-; inter-cid- 'fall away, slip away, escape,' about which there can be less doubt, seeing it is so frequently used of 'slipping out of the memory, being forgotten,' and thus exhibits a peculiarity common to the German verb ent-fallen; interfrigesc- (Vat. Fragm. § 155) lit. 'die of cold,' and so 'become obsolete or forgotten.' This metaphor brings to mind such passages as : 'Crimen de nummis caluit re recenti, nunc in caussa refrixit,' Cic. p. Planc.; 'illi rumores Cumarum tenus caluerunt, Cael. ad Cic. For a time a word is warm with life, in the end it dies of

<sup>&</sup>lt;sup>1</sup> Speaking of the boughs of the olive-tree. So Ovid has 'infringere lilia,' Cic. 'infringere florem dignitatis,' while Heinsius and Bentley would read in Horace 'teneros caules alieni infregerit horti.' All this seems to prove that *infringere* has an  $in = a\nu a$ .

<sup>&</sup>lt;sup>2</sup> Intermittere ignem 'to let the fire out,' Cato.

<sup>&</sup>lt;sup>3</sup> The Bembine Scholiast, quoted by Faernus ad Ter. Haut. iii. 1, 39, saw part of the truth, when he wrote: 'Inter et De tantundem significant, ad augmentum ostendendum. Hinc dicitur interfectus.'

coldness and neglect. Inter-im- 'take off,' i.e. 'kill' (comp. aν-aiρε- and ab-sūm-); inter-fic- 'make away with, 'put out of the way,' i.e. 'kill ;' inter-i- 'pass away, i.e. 'die;' also the expressions, 'he is gone,' 'decessit.' About the Latin verb interi-re I had for a time much doubt, which was raised by a consideration of the German unter-gehen, lit. 'to go down, sink,' and hence applied to the 'setting of the sun,' &c. and by an easy metaphor to 'dying.' Had the Romans ever used inter-ire as they do occidere of the 'sun going down,' I should scarcely have doubted that it attained the sense of dying in this way; and then I must have admitted its substantial identity with the verb untergehen. But this German verb has a separable prefix with the accent on it, so that I could lay no claim to it.

In this enumeration I have omitted many compounds with inter, though fully satisfied that they belong to our preposition, as inter-clud- 'shut off,' inter-nosc- 'know one from another' = δια-γιγνωσκ-, inter-sepi- 'fence off,' inter-cid- 'cut off,' inter-vert- 'divert,' inter-pung- 'point off or separate by a point;' inter-scind- 'cut off.' At the same time I feel that such words admit of an interpretation by means of the ordinary inter, so that they should rather wait for a decision upon the words previously quoted than be adduced in proof of my doctrine. The same argument applies to many German verbs, as unter-scheiden. Still I am satisfied that the inseparable unter is always a secondary form of the German ent and the Greek ava.

The sense of 'again,' so familiar in compounds with the Greek ava, serves also to explain the strange verb inter-polare, and the adjective inter-polus (or interpolis), from which it is evidently derived. Forcellini is no doubt right when he says, 'proprium artis fullonicae,' which is fully supported by the phrase, togam praetextam quotannis interpolare, Cic.—and probably he is also right in connecting it with *polire*, for this word also belongs to the same business, being the equivalent in form and meaning of our own verb to full (cloth). Thus inter-polus, strictly used, should signify, 'fulled anew,' and accordingly it is so used by Cicero's friend, the lawyer Trebatius: 'Si vestimenta interpola pro novis emerit' (Dig. xviii. i. 45). Again when Cicero (in Verr. ii. 1, 61) uses the word of one who having made an erasure in his books subsequently polishes up the rough surface in order to hide the fact of erasure and substitute of new words, the verb in itself denotes only the repolishing, and not the interposition of new matter. It is only in later times that the notion of inter 'between,' was able to bias the interpretation. In Plautus, at any rate, the word, used metaphorically, is simply 'to vamp up anew, to furbish up old things and give them a new shape.' Pliny perhaps may have felt the wrong bias when he uses the word *miscetur* in the passage about the plant broom (spartum): 'Est quidem eius natura interpolis, rursusque quamlibeat (or quamlibet) vetustum novo miscetur.'

I next quote inter-roga-. This word is commonly translated 'to ask,' but this is to ignore the prefix; a neglect the less pardonable, as no family of words exhibit in their prefixes a more distinct power than the other compounds of roga-, e-roga-, pro-roga-, in-roga-, sub-roga-, ob-roga-, ab-roga-, ar-roga-, de-roga-, prae-roga-tiva. The present theory on the other hand

secures to this *inter* a very clear meaning of its own, if we class it with such verbs as ανα-κριν-, unter-suchen. Nay, we find its representative in the Old German intphrag-en 'requirere,' where the int is in immediate relation to int-er; and the German verb frag-en has probably the same root as roga-re. Moreover the meaning thus claimed for interroga- exactly accords with its use in legal language, viz. the searching examination of witnesses and suspected persons. See the Digests, Livy and Tacitus; and Forcellini, sub v. interrogatio. Among the Romans legal terms often passed into the language of common life, and of course with much carelessness, so that interroga- is often found usurping the place of the simple verb. Inter-vis-(Plaut.) admits of similar explanation. As vis- means 'go and see,' so inter-vis- means 'go and hunt up, go and see thoroughly into.' The idea of 'through,' which is expressed by the prefix of ava-τιτρα-, is often found with inter in Lucretius, as inter-fod- 'dig a passage through' (iv. 716), inter-fug- 'fly through' (vi. 332), and inter-datus 'distributed through' (iv. 868). For the last compare ανα-διδωμι. So also interspira- 'breathe through' (Cato), inter-luce- 'shine through' (Verg.), inter-luca- 'let the light through' (Plin.), inter-fulge- 'shine through' (Liv.).

Having thus been brought back to the region of the Latin language, and endeavoured to re-establish the long-ejected *inter* 'up,' &c. in the possession of its rights, one is naturally led to cast an eye back to what has been said of Latin prefixes in the earlier part of this inquiry; and the retrospect will repay us in some measure for the trouble. If my views have been right, it follows that our prefix *inter*- is but a compara-

tive of the prefix ad- or in- 'up,' and thus their compounds may possibly exhibit instances parallel to the Anglo-Saxon on-gitan 'to perceive,' under-gitan 'to perceive;' on-secan 'to inquire,' under-secan 'to inquire;' German ent-lassen 'to let off,' unter-lassen 'to leave off;' ent-sagen 'to renounce,' unter-sagen 'to interdict;' where, as the forms differ solely in the unimportant addition of a comparatival suffix, so the meanings are nearly identical.

Such are found in Latin also. I refer not merely to the theoretic verbs imprendere and interprendere, to which our English nouns emprise and enterprise conducted me, but to pairs of words well established in the Latin vocabulary: ad-misce- 'mix up,' inter-misce- 'mix up;' acquiesc- 'rest after labour,' inter-quiesc- 'rest after labour;' ad-aresc- 'dry up,' inter-aresc- 'dry up;' ad-bib- 'drink up,' inter-bib- 'drink up;' ad-im- 'take away;' inter-im- 'take away;' and perhaps also to in-cid- 'cut off,' inter-cid- 'cut off;' in-fring- 'break off,' inter-fring- 'break off.'

It will have been observed that the instances of compounds with *inter* have been drawn in a great measure from the older writers,—Cato, Plautus, and Lucretius. This is to be accounted for on the reasonable ground that the more familiar preposition *inter*was gradually intruding itself upon the minds of the Romans to the detriment of our *inter*-. A preposition which has a separate existence, and may be used before nouns as well as in composition with verbs, has a great

<sup>&</sup>lt;sup>1</sup> The latter verb is only used in the sense of death taking a person off, but even here compare Horace's two expressions, 'Mysten ademptum,' and 'Asdrubale interempto.'

advantage in such an encounter over one which occurs only as an inseparable prefix to verbs. Hence our *inter* gradually lost much of its vitality, so that it was no longer competent to form new compounds with it; and those existing, one after another, disappeared. Under these circumstances the old authors naturally contain a larger supply of such compounds than those of later date. The same state of things exists in the German language, where it is now much more practicable to establish a new compound with *unter*, signifying 'under,' than with the inseparable *unter*, which leaves the accent for the following syllable.

On reviewing what has been here written, the fear suggests itself that the mind may revolt against a theory which involves the doctrine that prepositions of different origin and power frequently assume an identity of form. For example we have—

```
Latin . . . . ad = to, Eng.
                                   another ad
                                                  = ava.
              in = in \text{ or on, Eng.} \longrightarrow in
                                                  = ara.
                                    - inter akin to ava.
              inter from Lat. in

                                                  = a \nu a.
```

Nay, the Greek ava itself seems to represent two independent particles; for, besides the ordinary preposition, we have something very like the Gothic ana (= our on and in) in such phrases as ava στομα εχειν 'in ore habere,' ava θυμον εχειν 'in animo habere,' ava τους πρωτους ειναι 'in primis esse,' examples I take

from Liddell and Scott's Lexicon, but with my own translation. A similar power exists in ανα-κολλα- 'glue on or to,' &c. But if such confusion be startling, an examination of other prepositions would lead to similar results. For example, the Latin di or dis, Greek δια. German zer, Old Norse tor, appears in Anglo-Saxon and old Frisian as to, and thus encounters that other preposition to, which we still possess, corresponding to the German zu. Both are used in these languages as prefixes to verbs. Thus in old Frisian we have todelva = 'zu-graben,' 'dig up (earth) and throw it against (an object),' and to-delva = 'zer-graben,' 'dig to pieces; in Anglo-Saxon to-dælan 'attribuere,' with to-dælan 'disjungere;' to-weorpan 'adjicere,' with toweorpan 'disjicere;' to-clevan 'adhaerere,' 'cleave to,' with to-clevan 'diffindere,' 'cleave in two.' In this last example the confusion is increased by equivocal prefixes falling in with verbs no less equivocal. Anglo-Saxon scholars may perhaps be able to say whether there was a difference of accent to distinguish such verbs. Still in written prose the only security against error was in the context. Such a state of things must have been highly inconvenient; and the struggle in Anglo-Saxon between the two prefixes appears to have ended in the utter annihilation of both sets of compounds, for we no longer possess a single verb compounded with either the one to or the other, at least as a prefix. Yet to = dis was still a living prefix for Chaucer, Shakspere, and the translators of the Bible.

Another marked example occurs in the Irish language. Here two prepositions originally distinct in form, and directly opposite in power, de 'from,' and do 'to,' have for the most part (Kilkenny excepted) fallen into an awkward identity of form, do; so that nothing but the variety of accent and the sense of the adjoining words are left to distinguish them (see Leo, Ferienschriften, 1852, p. 195).

In the Latin language the prefixes de 'down,' and di or dis 'in two,' are constantly interchanging their forms, so that often the sense alone is a guide to the etymology of a compound. Nay, the poor word discribere 'to distribute in writing,' has utterly escaped the notice of all our lexicographers, the form describere 'to copy,' being allowed to usurp its place. Similarly the prefix in ('not') of insanus is in form undistinguishable from the in of inire. Thus infectus represents two different words, as also invocatus, and according to our lexicons insepultus also, but this last assertion is the result of a mere blunder.

In the same way the Greek ava and av- privative become one externally when prefixed to a word with an initial vowel, so that avisow might à priori signify either 'I render unequal,' or 'I equalize again.'

Another fear which weighs upon me is lest it should be supposed that I would derive all the particles I have dealt with directly from the Greek ava. The habit of treating one language as deduced from another has been carried, I think, to a most unreasonable length. Sometimes we are told that the Latin is derived from the Greek; at another, that it is made up of two elements, one Greek and one Keltic. No doubt it is easy in such cases to produce a large stock of words more or less similar in the compared languages; but this proves only a connexion between them, not that one stands in the relation of daughter to the other.

To call them 'sisters' would be a better metaphor, though even this is somewhat objectionable, for in the life of a language there is no such breach of continuity as between a parent and a child. The Greek, Latin, Sanskrit, Keltic, and Teutonic races, not to speak of others, have a large amount of common property in language, which with small exceptions they no way owe to each other, but have received from their ancestors. Were it possible to trace up each variety of language spoken by these races, we should probably see the similarity gradually increasing and at last merging in identity.

In conclusion, I would observe that a consideration of the arguments put forward in this paper will show that they ought not to be considered as a chain, where weakness in one link would endanger the continuity of the whole, and so invalidate all the results. Their nature is such that they constitute rather a close network, and the presence of a rotten thread here and there no way threatens disunion, the adjoining meshes compensating for the deficiency. Or, in plainer English, I would request any one who may have had his doubts about isolated points of the argument, to ask himself whether these doubts are not removed by other parts of the paper, for each branch of the discussion has its bearings upon the other branches.

## П.

## ON THE PREPOSITIONS $\epsilon \nu \iota$ , in, AND RELATED WORDS.

The inquiry into the representatives of the Greek preposition ava in allied languages brought me into repeated contact with the Latin preposition in, and its derivative inter 'between.' The consideration then of this preposition in, and its allied forms in other lan-

guages, may next be taken up.

Grimm has more than once noticed the tendency of prepositions to appear at one time with only an initial vowel, at another with only a final vowel, an older form in his view having once possessed both. Thus, as he observes (D. G. iii. p. 252), the Gothic ana, whence the ordinary German preposition an and our on, takes in the Slavic languages the shape of  $n\alpha$ . This prefix na seems indeed to perform a double office, and at times to represent the Greek ava in its various senses of 'up,' &c.; as from the Russian dut' 'to blow,' nadut' 'to blow up,' 'inflate;' from ruit' 'to dig, 'naruit' 'to dig up.' Again in p. 254 Grimm throws out very doubtingly a suggestion that the Gothic du, Germ. zu, Eng. to, may be one in origin with the Gothic at, Old Germ. az, Eng. at, and so of course with the Latin ad, on the assumption that there

once existed an original preposition adu. A close connexion in meaning, and the possession of a dental consonant in common, seem by themselves to be an insufficient foundation for such a theory; and yet I believe the theory to be true, for the evidence wanted may be supplied, I think, from the Keltic tongues. In the Gaelic Grammar of the Highland Society, p. 27, appears the following:—

'The preposition "do" loses the o before a vowel, and the consonant is aspirated; thus, "dh' Albainn" to Scotland. It is also preceded sometimes by the vowel a when it follows a final consonant; as, "dol a dh' Éirin" going to Ireland. "Do," as has been already observed, often loses the d altogether, and is written a; as, "dol a Dhunéidin" going to Edinburgh."

It will be here seen that the writer treats the a thus alleged to be inserted as a matter too unimportant to call for explanation; but the strictness of modern philology will not allow any such assumption of intrusive letters, and we may safely assume that the a was fully entitled to its position in the phrase, and not a mere euphonic insertion. If we assume an old preposition ado, all the three varieties above seen are explained. Moreover, the assumption that ado is an original type which suffers more or less mutilation, according as the particle happens to come into contact with vowels or consonants in the adjoining words, is in exact agreement with the fate of the preposition aq in the same language. The use of this preposition in the formation of imperfect tenses in the Gaelic verb precisely corresponds with our own use of the equivalent particle a = in for the same purpose. Thus:—

1. Preceded by a consonant and followed by a

vowel, the preposition is entire: as 'ta iad ag éisdeachd' they are a-listening.

- 2. Between two consonants ag loses the g, and is written a; as, 'that iad a deanamh' they are a-doing.
- 3. Between two vowels the a is dropped and the g retained; as, 'ta mi 'g éisdeachd' I am a-listening.
- 4. Preceded by a vowel and followed by a consonant, it is often suppressed altogether; as, 'ta mi dèanamh' *I am a-doing*.

Indeed this very preposition ag of the Gaelic seems to supply another example of the same principle, for we find standing beside each other 'ag' at and 'gu' to, which I am strongly disposed to regard as deducible from a common source, agu. Nay, it is highly probable that this agu is but a variety of the Gothic ado, for the interchange of the guttural and dental medials is not rare in the Keltic tongues. Thus, while the Gaelic has a preposition gu or gus 'to' or 'till,' the Manx commonly writes qys, but at times replaces this by dys; and, as Leo observes, the identity of the Manx qys and dys is proved not merely by their identity of meaning, but also by the appearance of the same letter-change in gyn 'without,' and dyn 'without' (Ferienschriften, Halle, 1847). We may even go farther, for it seems not impossible that in the German bis 'till' we have a third variety of the initial consonant. Compare the relation which exists between the Latin bis and the Greek δις 'twice.'

What has been said in favour of a close connexion in form between the prepositions at and to, receives strong support in the equally close connexion as to meaning. It is true that now-a-days there are but few phrases in which an Englishman can indifferently

use at and to. But that such distinctions are in origin quite arbitrary is proved by many arguments. It is considered more correct to say, 'I live at Oxford,' yet in parts of England the preposition to has preserved its footing in this form of words, as 'I live to Plymouth.' The same variety prevails in some parts of the United States, where 'I live to Boston' is in common use; and it may be observed, that nearly all those terms and phrases which are supposed to be corruptions, and of recent formation in that country, are genuine portions of the language which early emigrants carried out with them from the old country. I once heard ex-President Jefferson say that he had himself traced a very large number of such peculiarities to their provincial site in England. Again, where we say at home, the German says to house (zu hause). But perhaps the most marked example of their equivalent use is seen in the employment of the prepositions before an infinitive, where the Swedish att taga and Danish at tage correspond to our phrase to take. In the present day at is commonly preferred where rest is implied, and to in order to denote motion. Yet we say, 'arrive at a town,' 'throw a stone at a pig,' and, on the other hand, 'he lives close to the church,' 'he sat next to me.' Thus we may fairly conclude that at and to are substantially one in sense and probably one in origin.

If Grimm be right in identifying the Gothic bi, Old Germ. pi, bi, Mod. Germ. bey, and Eng. by, with the Greek  $\epsilon \pi \iota$ , then, as there can be no doubt that the Latin ob represents this Greek preposition, it will follow that our by and the Latin ob are identical. But

my doubt about the truth of the first of these propositions prevents my assenting, as yet, to the conclusion.

A clearer example of two prepositions concealing their affinity by the varied position of the consonant is seen in the German um 'round,' and the Gaelic mu 'about,' two words closely akin, if not identical in sense, and the latter deduced from a fuller form, umu. Thus I am inclined to regard the Old German *umpi*, umbi, and Greek  $a\mu\phi\iota$  as secondary prepositions; while the old Norse um and Latin am, as well as the German um, Dutch, Danish, and Swedish om, exhibit the preposition in its simpler form. It is somewhat strange that Grimm should have failed to quote the Latin am, which is well seen in the compound verbs am-icio and am-plector, as well as in the adjective an-ceps; and though the Oscan abl. amnud be no longer regarded as = anno, the notion of a circle explains the forms annus, annulus, ānus, solemnis, peremnis, while the interchange of m and n in these words needs no external support. Even amare 'to love' may first have signified 'to embrace,' and so come eventually from am 'round.'

Grimm has no doubt truly explained the Swedish  $p\dot{a}$  (and Danish paa) as an abbreviation of  $upp\dot{a}$ , the equivalent of our upon (which also takes at times with us the reduced form 'pon). Thus the Greek  $\dot{\nu}\pi o$  on the one hand is identical with our 'up,' and on the other has its representative, so far as the consonant is concerned, in the first element of the Swedish  $p\dot{a}$ .

A similar relation probably exists between the English preposition of and the German von, Dutch van. To what Grimm has said on this subject (p. 262) I would add that the form with n is not altogether

wanting, as he says, to the English language. Our vulgar, but not on that account to be neglected, on, as used in the forms—'six on us,' 'two on 'em,' 'I wasn't a hurting on 'im,' for 'six of us,' &c.—represents the derived preposition von or Old Germ. fona, itself representing, as Grimm says, a fuller form af-ana, from the Gothic af = our off and of, the Greek  $a\pi o$ , Lat. ab. But in regard to this af-ana there is no more necessity for holding the last letters to represent the Gothic ana 'on,' than for assigning the same origin to the termination of the Gothic at-ana and at-ana; so that Grimm's scruple on this head seems groundless.

The inference to be drawn from these considerations is, that whenever a preposition appears in a biliteral form, consisting of a vowel followed by a consonant, we should always look around for a second form in which the said consonant has won an initial position, and should also ask ourselves whether an earlier form of language does not present a triliteral preposition consisting of a consonant between two vowels.

Now, if I understand Grimm rightly, he has committed an error in speaking of the preposition in. After comparing the Gothic ana 'on,' with the Greek ava and Slavic na, he proceeds to say that, although the preposition in is closely connected in signification with the Gothic ana, yet there is a marked external distinction, inasmuch as ana in its original form has always a final vowel, whereas in never exhibits such a vowel. Whatever be the case with the Gothic languages, he should not have passed over the Homeric evi. In the following investigation, therefore, it will not be surprising if we find the preposition evi and its derivatives appearing at times with, and at times

without, an initial vowel; and, indeed, already in the Italian nello, nella, nei we have an example of this.

Again, the Greek ενεροι 'those below,' and its derivatives,  $\epsilon \nu \epsilon \rho \tau \epsilon \rho \sigma$ ,  $\epsilon \nu \epsilon \rho \tau a \tau \sigma$ ,  $\epsilon \nu \epsilon \rho \theta \epsilon \nu$  'from below,' are with reason referred to the preposition  $\epsilon \nu$  as their source; but we are here brought to a variety of meaning, not so distinctly belonging to the preposition. The Latin superlative *īmo*- stands in a similar position. By form it may well claim connexion with the Latin in, for a more regular superlative in-imo-, which the analogy of pro-imo- = primo- and sub-imo- = summo- would suggest, would naturally be compressed down to imo-, just as the substantive animo- seems in the comic writers to have had a disyllabic pronunciation, something like âmo-; and such compression is confirmed by the shape which this word has taken in the French âme. Then as to meaning, although 'inmost' will suit not a few passages in which imo- occurs, yet the notion of 'lowest' seems more commonly implied. Nay, even the adverb imo or immo may have had perhaps for its original meaning 'at the bottom,' for the use of the particle is to correct those who give only a part of the truth, not going to the bottom of things.1 Still the two senses of 'in' and 'down' have a natural connexion. As prepositions generally are employed to denote the relations of place, and as the earth itself is the great object to which all motions and all positions are naturally referred, the ideas of 'further in' and 'further down' have a natural coincidence. Again, the Latin in before an accusative, and the Greek  $\epsilon \iota s$  for  $\epsilon \nu s$ , add the notion of 'into.' But where many meanings

<sup>&</sup>lt;sup>1</sup> Mr. Parry, in his Terence, has erroneously ascribed to me an etymology of *imo* which was never mine.

belong to a word, the right course is probably (see p. 46) always to give a preference to one which implies movement. Now if we accept downward motion as the primitive idea, when such descent is checked, as for instance by the earth, we arrive at the idea denoted by on; but if the motion be not so checked, then we come to 'into,' and that soon followed by the result of being 'in.' What is here said is quite parallel to the case of the Latin sub. In the preceding paper (p. 44) I assigned to that preposition as its primitive meaning that of 'up,' or rather 'upward movement,' and contended that it was when such upward movement was terminated that the preposition acquired the sense of 'under,' with rest.

Another instance of a word in which in carries with it distinctly the notion of 'down' is incurvus, which Forcellini was contented to translate idem quod curvus or valde curvus, but which really means 'bent down.' Hence in "The Eunuch" Archidemides, whom Chaerea speaks of as of the same age with his father, patris aequalem, and who is therefore an old man, is subsequently described as incurvus tremulus, &c. Again Cicero has the phrase Stesichori poetae statua senilis incurva, and the same writer quotes from a poet, Ramos baccarum ubertate incurviscere (Or. iii. 38). So again Pacuvius (Varr. L. L. v., p. 19 of Spengel's edition) used the phrase incurvicervicum pecus, corresponding to Sallust's pecora quae natura prona fecit. The verb inflecto shows less distinctness in its sense; but even this we find united with incurvus, as Incurvum et leviter a summo inflexum bacillum.

Inclinare is another word which, duly examined, will lead to the same result. In many cases mere

'bending' will satisfy the uses of the word; yet still it may be presumed that the preposition at first was not added without a purpose. We may safely assume, then, that the notion of 'down' belonged to the word when used of the declining sun, as in Juvenal's 'Sed iumenta vocant et sol inclinat;' or of the heeling of a ship, 'Merso navigio inclinatione lateris unius' (Plin. viii. 208); or of a tree laden with fruit, 'Palladis arbor Inclinat varias pondere nigra comas' (Mart. i. lxxvi. 8); or metaphorically of a declining condition, as, 'Inclinata fortuna et prope iacens' (Cic. Fam. ii. 16); 'Inclinatis iam moribus' (Plin. xxv. 162); 'Is primus inclinasse eloquentiam dicitur' (Quint. x. 1). Nay, even the ordinary use of the word to denote a moral inclination to any object is in harmony with the notion of descent, for down-hill action is of course the easier; and indeed this accounts for the formation of the words pronus, propensus, proclivis so used. (See the subsequent paper on pro.)

That instances of the prefix in with the sense of 'down' are after all but few, is a fact which finds its explanation on two sides. When the Latin language had once established the variety of in for an or ava 'up,' the particle  $in = \epsilon v$  was liable to confusion. On the other hand, the form de was no way ambiguous. But even this de will presently be claimed as a derivative from in 'down.'

As regards the forms infra, inferi, inferior, infimus, the best course is to compare them with the opposed family of words, supra, superi, superior, summus; and then we are led by an irresistible necessity to the conclusion that, as the latter series have their root in the first three letters, so inf must contain the more

radical portion of the former series. But inf being almost an unpronounceable combination of letters, we are further led to the assumption of an older form enefra, &c., following therein the analogy of many similar compressions. Thus umbra may be considered as a compression of on-ub-era, and so connected with the Latin nube- 'cloud,' the verb nub-ere 'to veil oneself: while nubi-la-re and nubil-um bring us directly to the forms  $\nu\epsilon\phi\epsilon\lambda$ - $\eta$  and German nebel 'mist.' If infula signify really a veil, and so stand for enef-ula, we have a case thoroughly parallel to that of inf-ra. Again, ομφαλο-, if it represent, as it well may, a fuller ονυφαλ-ο, and the Latin umbilico-, standing for onubil-ico-, bring us to Germ. nabel, Eng. navel; and unqui- for onuqui-, by the side of ονυχ-, to Germ. nag-el, Eng. nail.

Following these analogies then, we may conclude that inferi stands for en-ef-eri, a comparatival form which should have been preceded by a positive enefus or nefus. This has a somewhat strange appearance, but is in reality identical with the Greek veFos and Latin novus, for the interchange of the sounds f and w is no way rare, and indeed our own language supplies an apposite example in two varieties for the name of the same reptile, a newt and an eft. Similarly the Greek autos Eurining are now by modern Greeks (and as regards the v were perhaps in ancient times also) pronounced aftos Evripêthes.

I next consider the forms in which the vowel  $\epsilon$  or  $\iota$  being dropped, the liquid  $\nu$  occupies the initial position. Ne $\rho\theta\epsilon$ ,  $\nu\epsilon\rho\tau\epsilon\rho\sigma$ s are coexistent with the Greek adverb and adjective already quoted: but besides these there exists a superlative  $\nu\epsilon$ - $\alpha\tau\sigma$ s, which at any rate by its

ordinary signification of 'lowest' seems in a very decided manner to claim kindred with the root before us; and the use of the feminine  $\nu\epsilon\alpha\tau\eta$  or  $\nu\eta\tau\eta$  for the 'lowest string of a musical instrument' (lowest in position, but highest in note) confirms this view. But I have here to contend with what appears to be a rival etymology, for  $\nu\epsilon\alpha\tau\sigma$  bears to the adjective  $\nu\epsilon\sigma$  'novus,' precisely the same relation that  $\mu\epsilon\sigma\alpha\tau\sigma$  does to  $\mu\epsilon\sigma\sigma$ ; and this argument receives much encouragement from the fact that  $\nu\epsilon\alpha\tau\sigma$ , like the Latin novissimus, also signifies the 'last or most recent.' I shall presently give reasons for the belief that this new notion is not at variance with the idea of 'lowest.'

But it will first be convenient to look in other languages for the representatives of our root. Now the Sanskrit has a particle ni, used as a prefix to verbs with the sense of 'down,' as from  $ni + dh\hat{a}$ , ni- $dh\hat{a}$ 'deponere;' and from ni + as, ny-as 'dejicere.' Here again the two notions of 'in' or 'on' and 'down' belong to the preposition ni, so that from ni + qam we have ni-gam, 'to go into,' 'inire.' The Ossetic of the Caucasus, a language of the greater interest because it is one of the most outlying members of the Indo-European family, has also, according to Sjögren, a prefix ny of the same power, as ny-fyssyn, 'to write down,' ny-væryn 'to lay down.' Of the Slavonic languages it will be sufficient to take examples from the Russian, where we find niz' an inseparable preposition, denoting 'down,' as niz-lozhit' 'to lay down,' from lozhit' 'to lay ;' niz-padat' 'to fall down,' from padat' 'to fall,' &c.; besides the verb nizit' 'to lower.'

Again, the Lithuanian has a prefix  $n\hat{u}$  'down,' of

very frequent occurrence, as nu-degu 'burn down,' nu-teku' 'flow down' (see Nesselmann's Lexicon passim, and especially under the word nu). But this nu is a shortened form of an older nug 'down.'

The Teutonic languages also abound in examples which contain the root under discussion. usually find a dental consonant attaching itself to the particle. Thus the Danish has ned 'down,' used commonly as a prefix to verbs, e.g. ned-skryve 'write down,' ned-blæse 'blow down,' besides an adverb nede 'below.' The English language possesses still, at least in poetry, the simple neath, whence on the one hand the preposition be-neath, and on the other the derived words nether, nethermost. But the forms with the suffix containing the letter r (no doubt comparatival in origin) are of most frequent occurrence in the Teutonic dialects. Thus the German has nieder and the Icelandic nidr 'down.' This latter language has also a substantive nid, to denote the time when there is no visible moon, although the idea of 'down' is all that the word strictly denotes. (See Holmboe's Ordforraad.) On the same principle no doubt the Latin noct- Greek νυκτ- and νυχ- (as seen in νυχα, νυχιος, &c.), originally meant 'sun-down.' It was natural for a Roman to think more of the sun; but an Icelander, less happily placed, owes a very large part of his comfort to the light of the moon.

Thus we have seen the simple en or in taking to itself a suffix or suffixes with a varying consonant, as—1. A guttural in the Lithuanian nug, the Greek vvx of vvxa; 2. a dental in the Danish ned, Icelandic nid, German nied-er, English neath, neth-er, Russian niz; 3. a labial in the Latin inf-ra, &c. for enef-era; while 4. no consonant shows itself in the Chinese and Sanskrit ni, the Ossetic ny, the Italian ne, the Lithuanian nu or nu, and the Latin nu-, Greek vev-.

I have just used the words suffix or suffixes; but I am satisfied in my own mind that all these suffixes are of one origin, and I believe that the Lithuanian nug and Greek νυχ, standing for on-ug and ον-υχ, have preserved the suffix in its purest form. But I am here influenced by considerations which will be stated more fully in the subsequent paper on re and pro. Our own preposition on can no way be separated from the Latin in, Greek  $\epsilon \nu$ ; but I do not pretend to decide between the claims of these three forms, and should be equally pleased to find a variety en-ek, en-eq, or en-ech. This suffix, ug vx, &c., I believe to be of diminutival power. Just as Dr. Johnson speaks of the suffix le of our verbs sparkle, trickle, as diminutival in origin, yet bringing with it to these verbs the notion of iteration, so I think that nu-ere and vev-eiv have in the same way obtained the power of denoting a repetition of small acts.

But the liquid n habitually throws out an excrescent t or d, e.g. in tegument-um, from tegumen (tegmen), and  $\rho$ -os for and our. Such a d I find in the Greek end ov (Dor. endos), in the Latin indu-perator, and our own und-er (from on). On the other hand a t presents itself in the Latin int-us, int-er, int-ro, and the German unt-er. But here again the notion of down is felt, most clearly indeed in the prepositions under, unter; but also in the phrase endow yeypattal it is written below, and the adverb endotepo similarly used; as also in the Latin interula (sc. vestis) an undergarment, and the phrase aqua intercus (i.e. under the skin).

Inde is another instance of an excrescent d. But here caution is necessary, as scholars seem to have confounded together two independent words. Inde 'from this,' or 'hence,' is of course connected with the pronoun is, ea, id, of which, however, in rather than i is the base, as shown by the old nominative 'Is' of an Inscription (Rhein. Mus. n. f. xiv. 380, note), for the tall 'I' of this form goes far to confirm the doctrine I have contended for elsewhere (Philolog. Soc. Proc. III. 57), that all demonstrative pronouns once had a final n. Thus the derived ind-e is one with the Greek  $e\nu\theta$ - $e\nu$ , the d and  $\theta$  being alike excrescent.

But the preposition in also formed a similar  $ind-e = Greek \, \epsilon\nu\delta\sigma\nu$ , or  $\epsilon\nu\delta\sigma$ , with the notion of down. I refer to the familiar phrases  $iam \, inde \, ab \, initio$ , &c., in which the usual practice is to ignore the inde; but 'down from the beginning' is so thoroughly intelligible

<sup>&</sup>lt;sup>1</sup> In my paper on Excrescent Consonants (see below), I have given my reasons for so placing the hyphen.

that I hope it will be accepted as a more precise translation.

But this inde also enters into the formation of subinde, which must on no account be classed with deinde, pro-inde, &c., for in these the inde is the genitival
inde 'from this,' corresponding to the Greek  $\epsilon\nu\theta\epsilon\nu$ .
The literal translation of subinde is 'up and down'
(i.e. 'ever and anon'). The non-appearance of a particle to denote 'and' is in agreement with the habit of
the Latin language, which preferred hinc illine, pedibus
manibus, to hinc et illine, pedibus et manibus. Then
as regards meaning we have what is very similar in our
own combination 'off and on.' This subinde has of
course led to the Italian sovente and the French souvent.

I now venture to claim theoretic varieties, ond-uk and end-ek, as standing by the theoretic on-uk, en-ec; and then by decapitation the Greek verb δυ-, which under this view may well unite the two meanings commonly assigned to it of 'go in' and 'go down,' as used of sun-down, of diving, or in the phrase eis Aidao δυσασθαι. Our own 'duck,' used often like 'dive' in reference to water, but also in the sense of 'ducking' or lowering the head, as in passing under a gateway, is truer as to form than  $\delta v$ - and nu-, both of which it represents; while our 'dive' is another variety of the same word, the guttural and labial interchanging as in nix, nivis. The Greek δυπτω has also substituted a labial, as is usual in that language, for a guttural. On the other hand, by a similar decapitation endek leads to  $d\bar{e}$ , the long vowel of the latter corresponding to that of the preposition  $\bar{e}$  for ek. That our own down is of the same stock can scarcely be doubted. Perhaps as our preposition ab-ove led to a secondary

form abov-en or abov-en, which afterwards was contracted to aboon (see Jamieson's Dictionary), so down may be for dow-en.

I now go back to the adjective veos. That this word must at one time have signified 'low' follows at once from the use of the superlative veatos as 'lowest;' and the sense of 'low' is more likely to have been original in the word than that of 'new.' A relation of place is often found to coexist in the same word with a relation of time, but few will hesitate to give to the locative idea the priority of title. Thus ubi and ibi denoted 'where' and 'there' before they were used for 'when' and 'then.' Again, in the familiar phrase interea loci, the latter word appears in a sense which is not primitive. Still the question remains, how we are to connect the ideas of 'low' and 'new.' The explanation I would suggest is that a considerable duration of time is commonly expressed by the simile of a river. Thus we ascend the stream of time to the past, and on the other hand we come down to recent times. But there is also another view that may be taken. Youth and lowness of stature are coincident, and every inch of growth is an evidence of increasing age. Thus veos might pass through the meanings 'low, young, new.'

Perhaps on the same principle we may be permitted to explain the German adjective alt, which is represented among ourselves by old. This German word bears a tempting resemblance to the Latin altus, but a resemblance not nearer than that of the German adjective neu to the Greek veF-os. Is it possible, then, that 'high' may have been the original sense of the German alt?

And if this be true, we are brought to the Latin al-ere 'to raise,' and the Greek  $a\iota\rho$ - $\epsilon\iota\nu$  of like power, the root-syllable of which I assume to be  $a\rho$ , for the fuller form  $a\epsilon\iota\rho$ - $\epsilon\iota\nu$  seems to be the result of reduplication. The Latin adjective ard-uus differs only in having an excrescent d. Possibly, too, the preposition  $a\nu a$  may be an offspring of the same root; and if so, both  $a\nu a$  and  $\epsilon\nu \iota$  will be deduced from verbs.

## III.

## ON THE LATIN PREPOSITIONS re AND pro.

I BEGIN this inquiry by once more quoting from the "Deutsche Grammatik" (ii. 865), the following passage:—

'The doctrine which holds true generally of particles, that they become obscure in signification and disguised in form, is specially applicable to the in-

separable particles.'

The little word re of the Latin language belongs to this class, as it is never found doing duty as an independent preposition, but occurs only in compound verbs or adjectives, and words deduced from them. It further deserves attention, in that it is difficult in the sister languages to find its representative. precisely in short forms of this kind that the destructive habit of language is found to have been most violently at work. Already the longer form red (redeo, red-do, red-igo) exhibits a final consonant that once belonged to the particle. We must also claim ret as a variety, for ret-ro is a more trustworthy division of this adverb than re-tro. This appears from the corresponding adverb por-ro, the first syllable of which exhibits the simpler form of the Latin preposition which led to the derived preposition pro, i.e. por-o. Indeed the simple preposition por has been

preserved in the verb por-rig-o, afterwards compressed to porgo and pergo; and virtually in polliceor and pollingo 'I lay out (a corpse).' But to this preposition pro I shall have to recur again.

But even ret is not the oldest form of the particle. The dental is in all probability a corruption from a guttural. Such a change is common to the last degree in language, and especially in the Latin language. our own, for example, the diminutival suffix et has grown out of an older ick: thus, emmet and gimlet are known to have superseded emmick and gemlick, So again the Latin abiet- stands in place of abiec-(witness abieg-no-); and as I have elsewhere noted, the frequentative verbs, vell-ic-are, fod-ic-are, morsic-are, have the suffix in a purer form than ag-it-are, quaer-it-are, clam-it-are. It is true that this latter variety outnumbers the former in the proportion of about a hundred to one; but it is not by numbers that such questions should be decided. The change from a guttural to a dental is a far more familiar matter than the converse; and in the case of Latin frequentative verbs this particular change was encouraged in a large number of instances by the precedence of a guttural in the simple verb, as for instance in the three verbs just quoted. But in the instance of ret, we have a confirmation in the fact that rec has been preserved in recu-pera-re, 'get back,' a compound of parare, and in the adjective reci-proco-, 'backward and forward.' The verb recu-perare has met with much ill-treatment among philologers. It was once the practice to regard it as a derivative from recip-ere, and even Varro (L. L. vii. 5, p. 358) sanctions this view; but this leaves the era without explanation;

for volnerare, onerare, derive the syllable er from the nouns volnus volner-is, onus oner-is. Again for many years there was to be found in the "Gradus ad Parnassum" and similar works a statement that the u of recuperare was a long vowel, and a line ascribed to Plautus used to be quoted in support of the assertion. But the said line did not come from Plautus, whose writings on the contrary contain many passages to prove the reverse, the metres of this poet invariably demanding a short pronunciation, such as récuperare, récuperator. Of reciproco-, more presently.

But still further evidence in favour of the guttural presents itself in some of the allied languages. In the Greek ραχι-s ραχετρον 'back or spine,' we have evidently words of the same stock. So again in the German prefix rück (rückwürts, &c.), and the substantive rücken 'the back.' These again bring us to the Anglo-Saxon hrig 'back,' the Scotch and Old English rig, and the Modern English ridge.

On this evidence then I claim rec as an older form than ret or red or re.

But the particle has suffered more or less on the other side too. With myself the appearance of an initial r always raises the suspicion of a decapitation, and the Anglo-Saxon hrig is a witness in this particular case to the same effect; but I shall not be satisfied with claiming some initial consonant. A vowel also is missing; and in the selection of a particular vowel I am guided here, as in other similar instances, by the law of vowel-assimilation. As in the case of the Latin pro I was led to claim a vowel o as lost, the word standing for por-o, so for re I would suggest a preceding e, making ere, or rather

er-ec. Still closer is the parallelism when for pro itself I find fuller forms,—first, prod (prod-ire, prodesse); secondly, prot in the Greek προτ-ερο- (my reasons for denying the  $\tau$  to the suffix have been given elsewhere); and thirdly, a still older proc in the very adjective already quoted, reci-proco-. For the letter-change it may be useful to compare the varieties re, red, ret, and rec, as well as pro, prod, prot, and proc, with the negative particle hau, haud, haut, representing the Greek our and ov. Thus re and pro appear to me to be corruptions from disyllabic forms er-ec and por-oc. If I am asked what this guttural suffix denoted, what its power was, I answer that it is the diminutival suffix which, in my view, plays so important a part in language; and I point to a parallel case in the Teutonic family. The Old German durah, written also duruh and durah (Grimm, D. G. ii. 770), corresponding to our own through, seems to claim connexion in its first syllable with the substantive, which we write door, and a German thür, while the second syllable has all the appearance of being the suffix of diminution. I might perhaps put forward as examples of the simple preposition the adjectives dur-liuhtic, dur-nehtic, dur-sihtic, quoted by Grimm from the Middle German. Of course in our tongue the word through is but an abbreviation of thorough. Thus the Anglo-Saxon thurh-fare becomes, in Chaucer, thurg-fare, and in Shakspere (Merchant of Venice, ii. 8) through-fare, where we write thoroughfare. Again Shakspere in the same play (iv. 1) has throughly in the sense of our thoroughly; and in the Midsummer Night's Dream we find: "Thorough the distemperature we see the seasons alter;" and "Over hill over dale, thorough bush thorough briar, over park over pale, thorough flood thorough fire."

But if ec of the theoretic erec be a suffix, we have for the base of the word er,—that is, a prefix wellknown in German. In the examination of this prefix, a first duty is to consult the "Deutsche Grammatik." Accordingly I have read with some care what is contained in the article on the subject in the second volume of Grimm's work (pp. 818-832). What he says on the Gothic vocabulary I have checked with the lexicon of this language attached by Massmann to his edition of Ulphilas. But though all linguistic inquiries should include an examination of the oldest forms of language, this should not be to the exclusion of later varieties, and this for two reasons, that remains of the oldest forms of a language are for the most part very fragmentary, and not unfrequently difficult of interpretation. With a language still spoken these two evils are less to be feared. Thus I should deem it most unwise to throw out of view what lies before us in Modern German. Under this impression I have tabulated to a great extent the German verbs compounded with er according to the meanings assigned to them in Meissner's Wörterbuch, taking this work because it happens to be at hand. The result of my examination has been to assign to the preposition the following meanings:-

1. *Up.*—In support of this, I might quote nearly forty examples, including both physical notions, and those of a secondary or metaphorical character; but am satisfied with *erstehen* 'stand up,' *erhalten* 'sustain,' *erspriessen* 'shoot up,' *ersteigen* 'climb up,'

erheben 'heave up,' erschwellen 'swell up,' erbauen 'build up,' erbrausen 'surge up,' ertragen 'support,' erdulden 'suffer,' ernähren 'nourish,' erziehen 'bring up,' to which should be added the adjective, or rather participle, erhaben 'elevated.'

- 2. Back.—This sense naturally grows out of the preceding, inasmuch as the downward movement of substantial bodies, through the action of gravity, is more conspicuous, and thus apparently more natural, than the corresponding ascent of what is often invisible, and so the upward action is regarded as a reversal of the first. Examples are—erlassen 'remit,' erkaufen 'ransom,' erschallen¹ 'resound,' erhallen 'resound,' ertönen 'resound,' erklingen 'resound.'
- 3. Again is a meaning which flows from, or rather is scarcely separable from, the preceding. This meaning occurs in erkennen 'recognise,' erneuen 'renew,' ersetzen 'replace,' erquicken 'revive,' erfrischen 'refresh,' erinnern 'remind,' erlösen 'release,' erlaben 'refresh,' erholen 'respire,' and ersinnen (sich) 'remember.'
- 4. Reversal of the act expressed in the simple verb.
  —In p. 830, sub-section 8, Grimm deals with instances that fall under this head. In the Gothic indeed he finds no example, but gives not a few from the Old German: as ur-erb-an 'exheredare,' ir-hals-an 'decollare,' ir-hirn-an 'excerebrare,' ir-këz-an 'oblivisci' (where-the root-syllable corresponds to our get in for-get), ar-meinsam-on 'excommunicare,' ur-wir-an

<sup>&</sup>lt;sup>1</sup> In this verb *erschallen* and those following, the notion of loudness expressed by the idea of 'up' may perhaps be preferable. See remarks below on the Latin verb *recita*.

'castrare.' Again for the Middle German he quotes er-kirn-en 'enucleare,' but for the Modern German he expressly says there is no example. We may perhaps venture to doubt the correctness of the writer both as regards the Gothic and the existing language of Germany, when we find uslukan 'unlock,' and usluknan 'open oneself,' in Massmann's Gothic Vocabulary, as also erlösen 'unloose,' and erschliessen 'unshut' (to borrow a good Old English word), in Modern German, a verb the more interesting as corresponding most precisely to the Latin recludere.

5. Reaching.—The effort to reach an object may be exercised in all directions, as downward, to get at water in a well, or horizontally, as in one of Hood's comic poems, where a child, shut in by the bar of its little chair, stretches out its arms to get at some fruit, and, unable to effect its purpose, adopts the ordinary revenge of crying, so as to justify the witticism written below the picture: 'Squall at Long Reach.' But in ordinary life the difficulty is more commonly to reach what is above us, as with the Fox and Grapes. the combination 'up to' readily expresses the idea of reaching, and the to is virtually expressed in the accusatival form of the accompanying noun. we have ereilen 'overtake, fetch up,' erfahren 'overtake by driving, come up with, erfassen 'lay hold on (suddenly),' erfinden 'find out' (literally, let me add, by feeling), ergehen 'overtake, reach,' erlangen 'reach,' erlaufen 'overtake by running,' erleben 'live to see,' erpacken 'seize,' erraffen 'snatch,' erreichen 'reach,' erreiten 'overtake on horseback,' errudern 'reach by paddling or rowing,' errufen 'reach with calling,' erschleudern 'reach with a

sling-stone,' erschnappen 'catch with open mouth,' erschreien 'reach with crying,' erschreiten 'reach with a step,' erschweben 'reach by flying,' erschwimmen 'reach by swimming,' erschwingen 'soar up to,' erspannen 'reach by the span,' erspringen 'reach in leaping,' erstrecken (sich) 'reach,' ertappen 'overtake,' ertasten 'reach by feeling.' Note in the translations the repeated use of our two prepositions, up and over (over-take).

- 6. Up to in daring.—There may be added, as a sort of corollary to the preceding section, the reflective verbs, erdreisten 'to be bold enough,' erfrechen, erkecken, erkühnen 'to dare, presume.'
- 7. Getting, by the act of the verb.—A meaning closely allied to those of §§ 5, 6, but containing less of the physical action. It would be idle to enumerate instances, when in Meissner's Lexicon I find over one hundred examples. But the construction will be perhaps better understood if it be first pointed out that with compound verbs the accusative may be dependent either on the verb or on the preposition. The best proof of this is seen in such Latin sentences as Iberum copias traiecit, where we have Iberum attaching itself to the preposition, copias to the simple verb iecit. In the preceding sections (5 and 6) the accusative belongs to the preposition. Indeed in many of the examples the verb itself is clearly of an intransitive character.
- 8. Making (a) and becoming (b).—Where the preposition is compounded with adjectives to constitute a verb. The idea is closely akin to the preceding sections 5- and 7 and the two immediately following. Examples of this sense are tolerably numerous: (a) error

bitten, erfreuen, erhitzen, erniedern, erschweren; (b) erblassen, erbleichen, erblinden, ergrauen, erlahmen.

9. Opening.—This at first may appear strange, but the close connexion of the idea is evident from the very etymology of open, which in its root-syllable op is one with the preposition up. The examples seem but few: erbrechen 'break open,' erbeissen 'bite open,'

eröffnen 'open.'

10. Beginning.—This grows easily out of the last, or it might perhaps as easily be deduced from the sections headed 'up to,' and 'making,' for these are substantially one with the idea of commencement. For examples may be taken: erbrausen 'begin roaring (of the storm),' erdonnern 'begin to thunder,' erdröhnen 'begin to sound,' ereifern (sich) 'fall into a passion,' erglänzen 'begin to shine,' erglimmen 'begin to glow,' ergrausen 'shudder,' erkälten 'catch cold,' erkracken 'begin to crack,' erkranken 'be taken ill,' erröthen 'blush,' erschaudern 'shudder, be seized with horror,' erschrecken 'be struck with fear,' erstaunen 'be astonished,' ertosen 'begin to roar,' erzittern 'begin to tremble.'

11. Thoroughly or up to the sources (in a search), as: erforschen 'investigate,' erkunden 'explore,' erkundigen 'inquire after,' erproben 'test.'

12. Removal, disappearance.—This meaning may be explained in two ways. In removing a thing the first act is to lift it up. Again a thing in vanishing generally rises, vanescit in auras. It is especially in reference to disappearance by death that the German compounds with er are so used. Thus—erbeissen 'bite to death,' erbleichen 'turn pale and so die,' erdrücken 'press to death,' erdrosseln 'strangle,' er-

dursten (prov.) 'die with thirst,' erfrieren 'be frozen to death,' erhängen (sich) 'hang oneself,' erlegen 'slay,' erlöschen 'go out as a fire,' ermorden 'murder,' ersaufen 'be drowned,' erchiessen 'shoot (to death),' erschlagen 'slay, kill,' erschöpfen 'drain, exhaust,' erspiessen 'kill with a spear,' erstechen 'run through with a sword,' ersterben 'die (out), become extinct,' ersticken 'smother, suffocate,' ertödten 'kill,' ertränken 'drown,' ertreten 'trample to death,' erwürgen 'strangle.'

It has been assumed above that the Gothic prefix us and the German er are one. This is generally admitted; and in truth as the Gothic habitually has a sibilant, where an r appears in German, it is no matter for surprise that the Gothic form of our particle should be us, which then only takes the form of ur, when an r commences the simple verb.

Thus in the very limited vocabulary of the Gothic we find eight examples where Massmann translates the Gothic by the corresponding German verb with a prefix er, viz.: usfullian 'erfüllen,' ushafjan 'erheben,' ushahan (sik) 'sich erhängen,' ushauhjan 'erhöhen,' uslaubjan 'erlauben,' uslausjan 'erlösen,' ussteigan 'ersteigen,' usvakjan 'erwecken;' while eighteen other verbs which in Gothic began with us or ur, are represented in the same book by German verbs compounded with er, auf, or wieder. Hence no one need hesitate in identifying the Gothic us and German er.

In Old German the vowel varies so that we have ur, ar, ir, and er. As regards the u it is perhaps safe to assume that this vowel or an o had precedence over the weaker vowels, because a change from a strong vowel to a weaker is more in accordance with the

habit of language. Add to this that the German ruck 'a jolt,' and  $r\ddot{u}ck$  'back,' give support to the view that the vowel before the liquid was either u or o. My reason for including the sb. ruck will appear

presently.

If we may rely upon Grimm, yet another corruption of our particle is found in the Old-Saxon and Anglo-Saxon, where according to him it takes the simple shape a, as a corruption of as (ii. 819). But his view may be doubted, as this prefix, at any rate in Anglo-Saxon, seems better explained as a representative of the Greek ava. Indeed in the Greek language itself, as has been already noticed, the Æolic and Doric dialects, ordinarily employing the shorter form av in place of ava, under certain circumstances cut this down to a. Then as regards the Anglo-Saxon, although on is the ordinary representative of the Greek ava, there was a marked tendency in this language to exchange on for a, seeing that the ordinary preposition on got reduced to a, as still seen in our own aboard for on board, afoot for on foot, &c. I feel the more at liberty to question Grimm's theory that the prefix a is a corruption of as or us, because, in a few pages before (699), when he first puts forth the idea, he implies a doubt in his own mind by affixing a query.

The mention of the Greek preposition ava reminds me that in my paper on that little word I was led by a similar investigation to assign to it the successive meanings:—1, up; 2, back; 3, again; 4, reversal; 5, 6, loosening, opening; 7, commencing; 8, 9, removal; 10, 11, 12, thorough, thoroughly, including the special idea of searching up to the sources. And,

as I have already said, the meanings so assigned by me to ava have since received the sanction of Pott in his recent work on Prepositions, who expressly refers to, and so far adopts, what I had written. would beg then inquirers to contrast the meanings now assigned to the German er with the meanings assigned to ava, the parallelism being complete. I was at first led to the belief that ava and ere were but varieties of the same word, knowing, as I did, that a German, like our countrymen in Kent (a word which itself represents Cantium), habitually has e where others have a—as Albis 'Elbe,' Amisia 'Ems,' Catti 'Hesse'—and further knowing that an interchange between the liquids n and r, when not initial, is of common occurrence. But I was checked in this view by two considerations: one that the sibilant of the Gothic us seems entitled to precedence over the r of er, and secondly by the fact that in the 'Oberdeutsch' dialects, as Grimm informs us (p. 819, line 15), the prefix appears with an initial d, as der-warp, der-beizte, der-haben.

The loss of an initial d is not very rare; and in the present case the authenticity of the d is confirmed by the Latin dorsum 'back,' with which there must have been a co-existing variety dossum, as shown by Varro's adjective in aselli dossuarii and iumenta dossuaria, to say nothing of the Italian dosso and French dos. Moreover, the Latin dorsum, like our ridge, is often applied to a continuous mountain elevation, just as we have our 'Hog's-back' in Surrey. It may as well be observed that the combination rs, as seen in dorsum, is liable to several changes. At times an r in such a position vanishes altogether in the Latin language. Thus it is now a familiar fact that the Latin adverbs

rursum, sursum, prorsum, deorsum, took severally the forms rusum, susum, prosum, iusum; the last of which, found in the pages of St. Augustine, accounts for the modern Italian giuso, 'down.' Another change is that This is most common in Greek, as in of rs into rr. χερσος χερρος, αρσην αρρην. But the Latin language has many half concealed instances of the same. the nom. pater had previously passed through the changes, paters, paterr, pater, the last of which is justified by the use not only of Plautus and the older poets, but also of Virgil. This premised, I may safely assume as equivalent varieties, dossum, dorsum, dosum, dorrum, and dorum. Then, as regards the final letters um, I have long ago given my reasons for the belief that the neuter suffix um of the second declension has grown out of an older form ug or uc, corresponding to our own suffix ock; and this when I had not arrived at any idea of a connexion between the Latin dorsum and the German ruck, or rück. I am therefore now prepared to give my full consent to the doctrine that dorsum and ruck are substantially one, the intermediate links being dorug, doruc, and druc, or oruc.

I now return to the preposition in its Latin form, to deal with a question which naturally suggests itself. It has been seen in the examination of the German inseparable er, that it has its meanings best explained on the theory that the first meaning is 'up.' Shall I be justified in assigning this as the first meaning of the Latin re? My answer is in the affirmative; but, though in my view it is the original meaning, it must readily be confessed that the instances are few compared with the other meanings. Still this is no way fatal to the argument; nay, it is to be expected in

the constant changes to which words are subjected in both form and meaning, that the older a meaning be, the fewer are the examples preserved. In the first place I find what I am looking for in the adjective recurvo-. Our lexicographers are satisfied to translate this word as well as incurvo- without much attention to the prefixes. Now it has already been pointed out that incurvo- is not fully translated by any phrase short of 'bent down,' as when speaking of a branch weighed down by fruit, or a man bent down by age. In like manner the full power of recurvo- is only given by 'turned up,'-that is, it speaks of bending where the concavity is upward. It is thus well applied to the back of the dolphin, which Arion must have found to be so far a more comfortable, or at any rate a safer seat amid the troubled waves. Ovid was right then in his choice of an epithet when he wrote, Tergo delfina recurvo Se memorant oneri supposuisse novo (Fast. ii. 113). Even when the crow goes off with the gilt bowl, in its flight it would carry its feet behind it, and thus there is still a propriety of language when the same poet writes: Corvus inauratum pedibus cratera recurvis Tollit (ii. 251); for the bird's claws, in their natural position incurvi, in this altered state of things would have the concavity upwards. Both Virgil and Pliny use this epithet of the bucina, where again the eye has before it a concavity with an upward presentation. Repando- is another available witness in my favour. Here Forcellini speaks with some accuracy when he gives as its equivalent, 'retro et sursum reflexus;' in which, however, he would have done better to drop the retro et. He adds, too, the expressive words, 'qualia sunt dorsa et ora delphinum.'

Indeed the word is most commonly used of the dolphin, and the compound repandirostro- of Pacuvius was correct in form, though laughed at as an un-wieldy superfluity by Quinctilian. Again, when Cicero describes the attire of Juno Sospita in one of the Italian temples, we are at no loss to understand the phrase cum calceolis repandis. The verb recuba-re, as distinguished from the simple cuba-re, is intelligible, if we translate it 'lying with the head and back raised.' Such a position is well suited for Tityrus when playing on his oaten pipe; and indeed recumbere (like the Greek ανακεισθαι) with all accuracy denotes the attitude at meals. Accordingly, it seems to have been preferred for this sense in the later writers, as in Phædrus, the younger Pliny, and Justin, to accumbere; perhaps because the Romans of that day had lost the perception of the true meaning of the prefix in the latter verb, connecting it with ad, 'to,' rather than with an, 'up.' Just as recubare means 'to lie with the back raised,' so Celsus, speaking of a bedridden patient (ii. 4), uses the term residere, 'to sit up with the back raised,' or as we have it, 'to sit up in bed.' His words are: 'Contra gravis morbi periculum est, ubi supinus iacet porrectis manibus et cruribus, ubi residere vult in ipso acuti morbi impetu praecipueque pulmonibus laborantibus.' The Latin verb recitare, 'to read aloud,' finds no satisfactory explanation in the meanings commonly assigned to re. Now in discussing the powers of the Greek ava, I had occasion to refer to some thirty or forty examples in Liddell and Scott's Lexicon, where verbs of more or less noise, when compounded with this preposition, denote a loud noise: for example,

ava-βoa-ω and ava-κραζ-ω; and I quoted three phrases of our own where the idea of 'up' is expressive of loudness: speak up, raise your voice, you speak too low to be heard. An application of the same principle accounts for the peculiar meaning of recita-. In Horace's Dissolve frigus ligna super foco large reponens, the best way, it seems to me, of giving due force to the re

is by translating the participle 'piling up.'

Another word which invites consideration is the so-called adjective recenti-, which has at least the external appearance of a participle, and contains in what is clearly its first syllable precisely the form which I have been led to assign to the prefix re as once belonging to it. Nor am I startled at finding the syllable performing the office of a verb. I have long thought that prepositions are many of them verbs in origin; and some years ago, when one of the most valued members of the Philological Society of London, Mr. Garnet, opposed to the doctrine that all words are in origin verbs, the argument that not a few verbs themselves were deduced from prepositions, as to utter from out, to intimate from in, I was led to think that he had not gone to the bottom of the matter. Again it is under the feeling that so-called prepositions originally were expressive of change of place or motion, that I have claimed for the Latin in (and Greek  $\epsilon \nu$ ) the active idea of 'down,' as preceding the resulting position of on, and of into, as preceding that of in. So again with sub, I placed first among its meanings 'up,' and regarded the resulting position 'under' as secondary. That prepositions are actually used with the power of verbs is clearly seen in the well-known phrase, 'Up, Guards, and at them.' I

find then no difficulty in connecting a participial form recenti- with our so-called preposition rec as to form. But how as to meaning? Here also a fairly satisfactory solution presents itself when we look at such phrases as recens a lecto, a somno, a cena, 'only just risen from bed,' &c. I say, 'only just risen,' rather than 'rising,' on the authority of such a construction as: Roman veniens comitia edixit (Liv. xxiv. 7), 'immediately on his arrival he,' &c. A still stronger argument is found in the phrase of Persius, sub sole recenti, to represent Eastern climes, for 'under the rising sun' is exactly what we want, and is in accordance with most, if not all, the terms employed to designate the East, as Orient of the French, and the familiar geographical names of Anatolia and Levant.

But there stands in the way of my argument the adjective reciproco-, which I have already translated as 'backward and forward;' yet even this word will turn out to be not altogether refractory, for it cannot be separated from the compound rig and fur of the Scotch or from the ridge and furrow of our own Southern dialect. Rig and ridge I have already claimed as representatives of rec, and it is no less certain that the Latin porca (= poroca) is one in meaning and substantially in form with our furrow. Thus Festus interprets porcae by the phrase "rari sulci." It is true that Varro (R. R. i. 29, and L. L.

<sup>1</sup> My origin of this adjective, if indeed it need any support, receives it in an unmistakable manner from the line in Ennius:—

<sup>&</sup>quot;-- rusus prosus reciprocat fluctus feram."

iv. 4) makes porca the 'elevation' in a ploughed field, damaging his authority however by a foolish etymology. In the nature of things ridges and depressions go together, and so have a tendency to confound the words that denote them. Not unlike this change of meaning is that which has befallen the Latin versu-, for here also the ploughed field is the origin, but the word originally meant the 'turning' of the oxen between the end of one furrow and the commencement of another, yet after a time it came to denote the line of ploughing, for every new turn marked one line finished and another to begin. A far more pertinent example occurs in the Latin noun lira, which by one writer is used in the sense of 'ridge,' by another in that of 'furrow' (see Forcellini). Again, in our own language the words dyke and ditch, which in origin are the same word, are used at one time to denote the hollow made by the removal of earth, and at another the bank made by the earth removed. Thus an Irishman talks of hiding behind a ditch, which to the English ear sounds somewhat strange. Nay, the German furche itself has suffered from this confusion. Thus Campe, in his Lexicon, says: "Die von der Pflugschar aufgeworfene Erde die eine eben so lange Erhöhung ausmacht, als die Furche einer Vertiefung ist, wird von Einigen auch die Furche genannt."

Again, when we look at the idea expressed by 'back,' we come across what confirms the view. It is true that the human back generally presents only a vertical direction, but in nearly all other animals we see what is elevated, and more or less horizontal. A *ridge* of hills has the same character, and so also

a hay-rick. In the German noun ruck, 'a jolt,' we also find a short upward movement. Similarly in the roof of the Crystal Palace with its 'ridge and furrow' of glass we clearly denote the elevation by 'ridge,' the

depression by 'furrow.'

Still the ground is not clear unless I can establish in favour of the Latin preposition pro the notion of 'down.' Here again I cannot dispute the ordinary doctrine that forward movement very generally belongs to this word; but, as I have already said, first meanings are apt to disappear; and I shall think it enough to produce some clear examples in support of my views. Now the adjective prono- is the precise opposite in power of the adjective supino-, the two meaning respectively 'looking downward' and 'looking upward.' Thus Cicero (Div. i. 53) speaks of the three directions of motion, under the terms prono-, obliquo-, supino-, that is, straight down, oblique, and straight up; and with this authority in our favour we need not be stopped by the fact that for Cæsar the word had already attained in part to the notion of forward, so as to be used in the sense of 'obliquity' or 'slanting,' as is clearly the case in the passage (B. G. iv. 17); Tigna non derecta ad perpendiculum, sed prona ac fastigiata. The idea of 'downward' is also seen in Sallust (Jug. 98), Ilex paulum modo prona, dein flexa atque aucta in altitudinem. adjective proclivi- is habitually translated 'downhill.' The adverbs prorsum and prorsus seem not to obtain their full sense until represented by our English 'downright.' It has been long taught that in treating prepositions we should start from the relations to the earth. Now what is thrown perpendicularly downward

strikes the horizontal plane with all its momentum, whereas in an oblique blow a portion is of course wasted. But the first idea being so fixed by reference to the earth, the word is afterwards applied to a movement perpendicular on any plane, and there results what we may express by 'completely,' 'absolutely.' Among verbs I find no inconsiderable number where the motion of 'down' predominates, as procellere, procidere, procumbere, proclinare, proculcare, profligare, proicere, prolabi, proruere, prosternere (prostrato-), proterere; nor is it unknown to promittere, witness the phrases p. capillum, barbam, comas, sues ventre promisso, palearibus ad genua promissis. In the common phrase promere vinum, and Horace's depromere Caecubum, the idea is seen to prevail when we call to mind the Roman habit of storing wine in the uppermost part of a house. To explain the substantive propagon-, and verb propagare, Forcellini employs the phrase 'depresso ramo.' Propendere is a word more than once used by Cicero for the descent of the heavier scale in a balance. The verbs proscindere, provolvi, proturbare, and the participle propexo-, seem often to require the translation 'down;' and lastly prodere in two of its uses involves the same idea: first, in prodere memoria or memoriae, 'to hand down a tradition; and secondly, when it denotes 'betrayal or abandonment.' This will be seen when we compare it with the verbs deserve, destituere, used in a similar sense. He who is about to abandon what has been entrusted to his care (say an infant) sets it down in some exposed place and then goes away. Where language has to speak of a series of acts, it often expresses the first and leaves the others

to be inferred, as, for example, in the military phrase colligere vasa, the first of many acts in abandoning a camp.

But it will no doubt be objected to much that I have here said that the notion of 'down' is so closely allied to the notion of 'forward' that it is readily derived from it. When a person throws a stone, for instance, the forward motion is soon followed by descent. This is quite true, but the argument is applicable in both directions. When I want to throw a thing down, I naturally give it something of a forward impetus, rather than drop it on my own toes.

But I pass to another pair of words in which what we find in our dictionaries is not altogether satisfactory, profano- and profundo-. As fa-num seems to be the neuter of an adjective, and to signify 'consecrated' (ground), so we have a negative notion in the prefix of profano-. Again, profundo- should, I think, be translated 'without bottom,' so that Cicero's mare profundum et immensum contains something of exaggeration in both epithets. Now if the original meaning of pro be 'down,' we have a use of the prefix parallel to what is felt in demens, dedecorus, decolor.

There remains for me to say a few words on the verbs which I would connect with the particles re and pro. Calling to mind that re according to the theory is a corruption of a disyllabic form er-ec or or-uc, I am disposed to connect with it the verb ori-, which stands for or-ig-, as shown I think by the noun orig-or-. The meaning of course suits. I am also disposed to claim as of the same kin the Greek oper- $e\sigma\theta a\iota$ , 'to reach,' when I call to mind the German

verbs, which obtained this idea through the prefix er. But from the Greek ορεγ-εσθαι I think it impossible to separate the Latin verb regere, to which the sense of 'rule' is generally without reason ascribed, in the belief no doubt that it is connected with the noun rēg-, 'a king,' whereas this word is probably of a distinct origin and represents the Eastern raj or rajah, while req- means simply 'stretch,' and so 'make straight;' nor indeed would I object to the translation 'rule,' if the idea were limited to ruling straight The Latin noun regio (regionis), which of course comes from it, is correctly translated 'direction.' A Latin q, by Rask's law, is commonly represented in English by a k sound; but the law needs so far modification that in the south of England at least the k is supplanted by the palatal ch. Thus frang- of the Latin corresponds to our words break and breach, broke or broken and broach. We must therefore include in our family both the English verb reach and the English noun reach used in speaking of so much of a river as retains the same direction. But I would also claim the verbs arise and arouse, if it be true, as is thought by some of our best English philologers, that these do not contain any preposition, but have passed into rise and rouse by decapitation. these I add the Greek  $o\rho$ - $\omega$ ,  $o\rho$ - $\nu\nu\mu\iota$ , and  $o\rho\theta$ -os, with an excrescent  $\theta$ .

I next take the particle *pro*, and with it the substantive *porca*. The latter seems to point to the idea of digging; but this in its primary form is no more than scratching, which as applied to the earth is rather a horizontal than a vertical movement. This however is of no moment, as downward action soon becomes the

prominent idea. The verbs of digging accordingly seem to have been originally imitations of the sound that accompanies scratching. Hence χαρ-ασσ-ω, γραφ-ω, i.e.  $\gamma a \rho - a \phi - \omega$ ,  $\sigma - \kappa a \rho - \iota \phi a - \omega$ , g(a) r - aben of the German, s-c(a)r-atch and s-c(a)r-ape of our own language, and then with the loss of the initial guttural αρ-ο-ω, and ar(-a)-o of the Latin, together with the Greek  $o\rho$ - $v\sigma\sigma$ - $\omega$ . But the rough liquid r is often superseded by the soft l. Thus we have  $\gamma(o)\lambda-\nu\phi-\omega$ , and s-cal-p-o, and in a simpler form col-o, in which the title of 'digging' to the first place in meanings is established, not only by Latin usage, but by the fact that its Scotch analogue, holl, had no other meaning. But let us ask what shape would col- of Rome take in the mouth of The answer is that por might well be the prevalent form, it being the provincial habit of the country outside of Rome to present a p where the polished dialect had a c. Thus pitpit is the Oscan form of quicquid; palumbe-, 'the wild pigeon,' corresponds to columba-, 'the tame dove,' and the country people coming to Rome gave the cookshop which they frequented the name popina, when the city dialect would have preferred coquina. The doctrine that digging was the first idea represented by the Latin particles por and pro accounts for the power of the preposition per, 'through,' and at the same time for the fact that the Roman ear cared little for the distinction between per and por, writing at one time porgere, at another pergere, perinde as well as proinde. The Greek language too, in its verb πειρ-ω, 'I pierce,' and πορο-s, 'a passage,' presents us with words of the digging family, which have the precise form we should desire. I conclude then that reciproco- may well be translated by 'up and down,' and so correspond precisely to the Scotch phrase 'rig and fur.'

In this paper I have not dwelt at any great length on the various secondary meanings of the Latin re; but there is little difficulty here. Besides the primary notion of up, and the ordinary meanings of back and again, there is of course the not unfrequent meaning of reversing an act, which, strange to say, Professor Ritschl seems to deny in the Prolegomena to his Trinummus (p. lxxv.), where, in reference to the line

"Proin tu te, itidem ut Charmidatus es, rursum recharmida," he ventures, in defiance of the MSS., to substitute decharmida on the ground that such a compound with re can only mean 'rursus indue Charmidis personam.' As his authority is deservedly high, I deem it right to place the matter beyond dispute by a liberal quotation of examples to the contrary, viz. red-argu- 'disprove, refute, re-calcea-excalcea-, re-can- (Plin. xxviii. 19), and re-cin- (App.) 'reverse a charm, disenchant,' recanta- (Ov.) the same, re-cid-, implied in the adjective recidiuo- 'getting up again after a fall,' re-cing- 'ungird, re-clud- 'unshut' (so to say), re-cuti- implied in recutito-, re-fell- 'undeceive, refute,' re-feru- (Cic. Brut. 91) 'become cool again,' re-fibula- 'unbuckle,' re-fig- 'unfix,' re-fod- 'dig up again what has been buried,' re-frena- 'unbridle,' re-gela- 'thaw again what has been frozen,' re-glutina- 'unglue,' re-laxa-'unloose,' re-liga- (Catul. Lucan.) 'unbind.' relin- 'unwax' (so to say), re-ne- 'unspin,' re-nuda-'unbare,' red-ordi-(r.) 'unweave,' re-pect- 'uncomb (so to say), dishevel,' re-pignera- 'take out of pawn,' re-plumba- 'unsolder,' re-secra- 'undo what is

expressed by obsecra-,' re-sera- 'unbolt,' re-signa-'unseal,' re-solu- 'unloose,' re-string- (Plaut.) 'open,' re-su- 'unsew,' re-teq- 'uncover,' re-tend- (arcum) 'unstring,' re-tex- 'unweave,' re-torque- as in 'mentem laetata retorsit' (Juno in Verg.) 'smoothed again a soul so long by passion wrung, re-tura- (compared with obtura-) 'uncork,' re-uela- 'unveil,' re-uinci-(Colum.) 'unbind,' re-uolu- 'unroll,' re-uorr- 'unsweep (so to say) what has been swept.' Here are already over forty examples; and I have yet to add another, which cannot be dealt with in so summary a manner, for both editors and dictionary-compilers have done their best either to destroy it altogether or to falsify its meaning. I refer to the substantive recubitu. This appears to be an άπαξ λεγομενον. It is found in Pliny (xxiv. 13, 7), and to make the matter clear I must quote part of the passage:— Baculum ex ea' (he is speaking of the aquifolia or holly) factum, in quoduis animal emissum, etiamsi citra ceciderit defectu mittentis, ipsum per se recubitu propius adlabi.' Unhappily Sillig, abandoning the Paris MS. a, which he assigns to the eighth or ninth century, for a reading of the Paris MS. d of the thirteenth, gives, what is altogether senseless, per sese cubitu in place of per se recubitu. He probably did not know that recubitu would signify 'by ricochet.' On the other hand our current dictionaries are utterly false guides. Thus we find the word translated by Freund 'das Niederfallen' and by his copyists of course 'falling down.' One of these indeed assures us that while he took Dr. Andrews' (American) Dictionary as 'the basis' of his labours, 'each article was compared with the corresponding word in For-

cellini;' but it is difficult to reconcile this statement with what is to be seen under recubitus in the great Italian work, for here the true translation is distinctly given. After the general remark that recubitus means 'actus recumbendi' Forcellini adds the definite interpretation, 'subsultus ille quem faciunt corpora in solum durum incidentia, that is, what in shorter language we call 'ricochet.' This word has of course come to us from the French; but that it was previously imported into France from Italy may perhaps be inferred from the form of the prefix, ri in place of re. A genuine French noun would probably have been recouchet. But over and above identity of meaning, there is a close connexion in form between the Latin recubitu- and the modern ricochet. But a friend suggests that I must here assume a secondary verb recubica-re from which a substantive recubicatuwould readily flow, and then from a contracted recub'catu- we should be led to a French re-couch-et: and this view is confirmed by a similar series cubare, cubicare, coucher. Thus, while the obsolete cumb-ere meant 'to fall,' the compound recumbere, reversing the meaning of the simple verb, must have come to signify 'to get up again,' 'rise again,' before the derived substantive recubitu- could bear the interpretation 'ricochet;' much as from cadere, 'to fall,' we obtain first recidere, 'to rebound,' and then the adjective recidiuo-, 'rising again.' Of course after what I have said above (p. 75) on Latin frequentatives, I am very ready to give admission to such theoretic forms as cubicare, and the very idea of ricochet is thoroughly consistent with repeated action, whether we have in view the movement of an oyster-shell on the surface

of a pond, or of a cannon-ball on the surface of the sea.

One word more in apology for the wide space I have given to the consideration of the German er. I have long thought that insufficient attention is paid both in grammars and dictionaries to the power which such little words bring with them to the composition of verbs; and the want is nowhere more felt than in dealing with the German prefixes ent and er. I discussed the former in my paper on ava. I have now spent not a few lines on the corresponding problem for er.

## IV.

## ON THE GERMAN PREFIX ver AND ALLIED FORMS.

In the paper on ava and its analogues I had to dwell upon the fact that inseparable prefixes are apt, as Grimm says, to undergo violent changes both as to form and power; and upon the further fact, that in consequence of this liability, particles of totally different origin not unfrequently pass into an identity of form, thus bringing about a confusion, which ends in the disuse of both prefixes, and the employment of fresh forms of speech to make up the consequent deficiency. It is probably in this way that our own language has pretty well ceased to employ prefixes in the formation of compound verbs, finding it more convenient to take the simple verb and place after it an independent preposition; as, 'he put upon me, he put me quite out, he put me up to something, he put this bad practice down, he put off the meeting, he put the door to, he put his hat on, he would not put in more than sixpence.' Similarly we have take up, take off, take in, take to, with peculiar meanings, which give much trouble to the foreigner, as they are often left unexplained in our dictionaries. We have now no verbs compounded with a prefix to, although the Anglo-Saxon had many such, including both those in which to was an equivalent for the Latin ad, and

others with to = Greek  $\delta\iota a$ , dis of the Latin, tor of Old Norse, and zer of German, as to-brek, to-brest, to-hew, to-race, to-rend, to-shred, to-skatir, to-swink, of Chaucer; to-cleve, to-dele, to-drag, to-part, of the 'Ayenbite of Inwyt' (A.D. 1340). Even the Bible (Judges ix. 53) has the words, 'A certain woman cast a piece of millstone upon Abimelech's head, and all tobrake his scull;'—and so also in Shakspere we find:—

"Where (i.e. whereas) these two Christian armies might combine
The blood of malice in a vein of league,
And not tospend it so unmannerly."

King John, v. 2.

"Then let them all encircle him about, And, fairy-like, topinch the unclean knight."

Merry Wives of Windsor, iv. 4.

A similar case of the accidental confluence of prefixes originally distinct, and a consequent disappearance, is to be seen in the particle of. Here three independent words have fallen into an identity of shape. Thus in the older forms of our language, whether called Anglo-Saxon or Old English, we have this little word representing in turn what appears in Latin and Greek as ab ano, ob eni, sub ino. Examples of the first abound in Gothic in the form of a, as of a-drifan, 'to drive off,' of a-heawan, 'to cut off,' and of-ferian, 'to carry off,' of-irnan, 'to run off.' The Danish and Swedish also have numberless instances; but here, as in Gothic, the original vowel was preserved, af, not of.

With the word  $\epsilon \pi \iota$ , I have already claimed to connect our own aft, the t being excrescent; as it is also in aft-ana of the same language, compared with ut-ana,

our own aft-er, and the old superlative aft-uma. But em has yet another representative in the prefix of the Anglo-Saxon of-axian 'ask after,' of-ridan, 'ride after,' of-spyran 'search after,' and of-sitan, 'besiege' (obsidere); as also of the Old English of-seche 'seek for,' of-sende 'send for' ('Ayenbite of Inwyt,' Mr. Morris's Preface, p. lxvi.), and perhaps of the Anglo-Saxon of-licgan 'to lie upon.'

Taking sub and ὑπο next, I quote from the paper on ava, p. 41, the forms in our northern dialects which I hold to represent these; viz. Goth. uf, Old and Mid. Germ. uf, Mod. Germ. auf, Old Fris. op or up, Dutch op, Norse and Swed. upp, Dan. up, Eng. up, but Old Eng. also of. Now in the examination of the German auf, I find much that reminds me of what I came across in the study both of ava and its representatives and of the Latin re. Thus for German, leaving out of view the numberless instances where the idea of up is distinctly retained, I find (1) above sixty where the idea of 'opening' appears; (2) some eight of 'beginning,' auf-blühen, auf-brausen, aufjammern, auf-krähen, auf-kreischen, auf-lachen, aufseufzen, auf-toben; (3) of 'loud noise,' six: auf-lachen, auf-röcheln, auf-sagen = recitare, auf-snarchen, aufschnauben, auf-stöhen; (4) full fifty where 'completion' is denoted; (5) with the notion of 'back:' auf-behalten, or auf-bewahren 'reserve,' auf-halten 'hinder' (= inhibere), auf-krämpeln, auf-streifeln; (6) not less than fifty meaning 'again;' and (7), what is of much interest, nearly fifty in which the idea expressed by our English prefix un, i.e. the reversal of a former act, shows itself, viz. :-auf-binden, auf-decken, auf-drehen, auf-drieseln, auf-eisen, auf-fädeln, auf-falten, auf-fasen.

auf-fitzen, auf-flechten, auf-gürten, auf-häkeln, auf-haken, auf-hefteln, auf-heften, auf-hüllen, auf-klinken, auf-knebeln, auf-knöpfen, auf-knüpfen, auf-koppeln, auf-künden, auf-lassen, auf-leimen, auf-lösen, auflöthen, auf-nesteln, auf-packen, auf-rebbeln, auf-riegeln, auf-ringeln, auf-rollen, auf-sagen, auf-schliessen, aufschnallen, auf-schnüren, auf-schnurren, auf-schrauben, auf-schürzen, auf-spunden, auf-thauen, auf-weben, auf-weichen, auf-wickeln, auf-winden, auf-wirken, aufwirren, auf-zaubern.

To these I add two corresponding Swedish verbs,  $upp-t\ddot{a}cka = auf-decken$  and  $upp-l\ddot{o}sa = auf-l\ddot{o}sen$ .

The Anglo-Saxon, besides its many verbs compounded with of = 'off' (Latin ab), retained a few, as we have seen, where of = ob or  $\epsilon \pi \iota$ ; and again it has a small group in which of = the Germ. auf, as of-standan =auf-stehen, of-gifan = auf-geben, of-delfan 'dig-up,' of-frettan = auf-fressen, of-hæbban, 'retain,' like aufhalten; with which we should no doubt include ofblindan 'make blind,' of-munan 'remember,' of-lician 'dislike,' of-thincan 'repent,' of-unnan 'refuse,' from unnan 'give.' And I further quote again from Mr. Morris's Preface to his edition of the 'Avenbite of Inwyt,' or from the body of the work: of-thincke = 'forthink,' 'repent,' of-guo 'forgo,' of-healde 'withhold, of-take 'overtake,' of-serve 'deserve.' The last two verbs seem to call for a little explanation. take and over-take mean, as by etymology they should mean, 'catch up,' we have what is still a familiar phrase for the same idea. Then of-serve may well mean, like the Latin emeritus, 'serve out one's full time.' The same old English work which supplied these examples has also of-acksed for 'thoroughly questioned,'

of-dret for 'thoroughly frightened,' and of-tyened for 'thoroughly enraged.' Of-guo and of-guoinge also occur in the index of the same book, with the translation 'meriting or deserving,' but how this meaning is to be assigned to them I do not see. 'Overgoing,' like the Latin 'transgredi,' might mean transgression, passing the border of what is right, and so correspond to the German vergehen; but we cannot assign to the simple of 'up,' the notion of the comparative over.

But as the words with, hind, as has been just noticed, lead to secondary forms, wid-er, hint-er (hinder), and the simple preposition in to int-er in Latin, und-er Eng., unt-er Germ., so two at least of our prepositions also assume a comparatival suffix. Thus, to take first the forms allied to  $\epsilon\pi\iota$ , we have, as has been already said, aft and after in English, together with the Gothic afar without the excrescent t; and in the Ang.-Sax. overnoon (I take it from Bosworth's Dictionary) we have probably a variety of our afternoon and no compound from the more familiar preposition over.

Whether far and farther stand in the relation of comparatives to  $a\pi o$  ab and the Ang-Sax. af 'off' I will leave for future consideration. But on the other hand, as the Latin has alongside of sub both super and subt-er with an excrescent t (pronounced supt-er and frequently so spelt in good MSS.), and as the Greek too has  $i\pi\epsilon\rho$  from  $i\pi$  of  $i\pi o$ , so we find both upper and over in English and iiber in German.

But when a preposition has given birth to derived forms, it is very common for the initial vowel in such derivatives to disappear. This is a matter which has been considered at some length in the second paper on  $\epsilon\nu\iota$ ; and in accordance with what was there

said I now venture to claim the familiar Germ. prefix ver as a corrupted comparative of auf, in other words, as a decapitated variety of über 'over.' The corresponding Ang.-Sax. prefix of-er has in its f the very sound which is heard in the initial consonant of ver. But the best proof of the substantial identity of the two forms will be found in the meanings, as seen, first in the following individual words: ver-brücken 'to bridge over,' Ang.-Sax. ofer-brycgean; ver-jähren and ver-alten 'to become superannuated,' compared with Ang.-Sax. ofer-geare 'antiquated,' and ofer-eald the same; ver-kehren 'overturn,' ver-fahren and verführen 'transport;' ver-schlafen (sich) 'oversleep' oneself, ver-schiessen 'overshoot,' ver-schlagen 'strike (a ball) out of bounds,' ver-sprengen 'strike a billiard ball off the table; 'ver-walten 'administer,' and verweser 'manager,' i.e. 'one set over others;' ver-lesen 'call (names) over: 'ver-hehlen 'cover over' (conceal) = Ang.-Sax. ofer-helan; ver-sehen 'over-look,' i.e. 'neglect,' ver-achten 'overlook,' i.e. treat with contempt, ver-dunkeln 'darken over.' Ver-nehmen I would place alongside of the Lat. intellegere, and as I assign to this for its literal translation 'pick up (knowledge),' so ver-nehmen may well mean 'to take up,' like the Scotch uptake. (See paper on ava, p. 28.)

Secondly, I set down a whole class of words in which the notion of 'over' ('covering') in its physical sense is undeniable: verblechen, verbleien, verdachen, verdielen, vereisen, vergittern, verglasen, vergolden, verkleiden, verlacken, verlarven, verlatten, verledern, vermanteln, vermoosen, vermörteln, verpanzern, verpichen, verquecken, verrasen, verreisern, verrinden, versanden, verschalen, verschalmen, verschienen, ver-

schilfen, verschindeln, verschlämmen, verschleiern, verschmutzen, verschneien, versilbern (Comp. Ang.-Sax. ofer-sylfrian), versteinen, verstobern, vertäfeln, verzäunen, verzinken, verzinnen, verzuckern, together with verdecken, verhüllen, vermalen.

Thirdly, a class of words with the meaning of 'overmuch, excess:' verbluten 'bleed to exhaustion,' verfliegen 'fly too far,' verhitzen 'overheat,' verklettern 'climb too high,' verkochen 'overboil,' verpfeffern 'pepper too much,' verrennen (sich) 'run too far,' versalzen 'oversalt,' versauern 'make too sour,' verschneidern 'cut too short,' verschwärmen 'swarm too much,' verspäten (sich) 'come too late,' versteigen (sich) 'climb too high,' versüssen 'oversweeten,' verwürzen 'spice too much,' verzärteln 'spoil (a child) by too much tenderness' (with auf-zärteln the same), verzuekern 'sugar too much.'

Fourthly, with the notion of transferring, and so changing, bartering, selling, paying: verändern, verdeutschen (comp. the general term übersetzen), vergriechen, verfahren; vertauschen, verkaufen, verwechseln.

Fifthly, the notion of 'passing over,' 'getting to the end of,' and so 'consuming all,' of which the examples are too numerous to quote.

Sixthly, the notion of excess is akin to that of misdoing, as verdeuten 'misinterpret,' verdrehen 'distort,' verdrucken 'misprint,' verheben 'lift in the wrong way,' verkalben and verlammen (cf. our miscarry), verkennen 'mistake,' verleiten 'mislead,' verrathen 'betray,' verrechnen 'misreckon,' verrücken 'derange,' verchieben 'misplace,' verschleppen 'misplace,' verwöhnen 'spoil (a child),' verzählen 'misreckon,' verziehen 'draw

wrong, verzielen (sich) 'miss one's aim.' And with these may be included the notion of destruction or negation in the words verbieten 'forbid,' vergessen 'forget' = Ang.-Sax. ofer-gitan), verhören (= überhören 'not to hear,' and Ang.-Sax. ofer-herran or ofer-hyran); verlernen 'unlearn,' verthun (Ang.-Sax. ofer-don, our fordo); verschwören 'forswear,' with which compare the Ang.-Sax. ofer-cysan.

So far only the fuller forms (in ofer) of the Ang.-Sax. have been quoted; but of course this language has for as the ordinary form of the prefix, like the Danish for and the Swedish för. And the fact that Ang.-Sax. possessed both forms adds greatly to the argument which treats the German ver as the result of decapitation.

It must no doubt be admitted that it is difficult at times to find in the prefix an explanation of the meaning which it conveys to a verb. But the verb verdienen may well mean 'serve all one's time,' and so correspond to the old English of-serve above-mentioned, as having the meaning of 'deserve.' But the best proof that the prefix ver is but a decapitated über is found in the German vocabulary itself, as will at once be seen by prefixing first ver and then über to the following, and so testing their substantial identity; -blechen, -bleien, -brücken, -dachen, -decken, -dunkeln, -fahren, -gattern, -glasen, -golden, -heben (sich), -hören, -kochen, -lassen, -ledern, -moosen, -ölen, -pfeffern, -pichen, -salzen, -schiessen, -schleien, -schneien, -schnüren, -sehen, -springen, -tafeln, -zinnen.

In Latin it has been for a long time the habit of scholars to identify with our own for of forswear, fordo, forlorn, forget, forgive, the per of periurus,

perdo, pereo, perimo, perfidus; and no doubt with reason: and to these may be added peruideo, as found in Horace's

"Quom tua peruideas oculis male lippus inunctis, Cur in amicorum uitiis tam cernis acutum?"

for it seems to have been an unnecessary proceeding on the part of Bentley to give up the reading of all the other MSS. in favour of one. It is scarcely a grave difficulty that the Latin language also used peruidere in another sense, seeing that we give two different meanings to our overlook, and the Germans to their versehen and übersehen. But the Latin seems to have examples where the prefix per has the original meaning of über, over-viz. percell- 'knock over,' 'upset,' as seen in the use of this word in the very oldest writers, e.g. with plaustrum in Cato, quercus in Ennius, to say nothing of Plautus and Terence, both of whom have the word in its true physical sense. Peruert- again means 'overturn,' 'upset,' as with pinus proceras (Enn.), aulas and turrim (Plaut.), and especially in 'si réx obstabit óbviam, regem ípsum prius peruortito' (Stic. ii. 1, 14). The meaning over' gives the best interpretation to the compounds perfund-, perlin-, and perung-. A further claim must be put in for the intensive per of adjectives, like permagnus, permultus, especially when we compare this with  $\dot{\nu}\pi\epsilon\rho$  as a prefix to the adjectives  $-a\sigma\theta\epsilon\nu\eta s$ , -ατοπος, -ελαφρος, -καλος, -λαμπρος, -πικρος, -πολυς, -σοφος. The assumption here made is that super was cut down to per, and the loss of two letters may offend; but such loss may well have been gradual, first one letter disappearing, and then the other. Thus

the Lat. sub (pronounced sup) seems to have lost its sibilant in one derivative, viz.: aperio apertus, the root syllable of which is the same as op of our op-en and our preposition up. This will be more readily accepted if contrasted with op-erio op-ertus. That ap-eri- and op-eri- (with their participles ap-er-toop-er-to-) have their origin in prepositions is a matter on which I have little doubt, the eri of these words corresponding to the eli of sep-eli (sep-ul-to-), the root of which is one with  $\theta a \pi$  of  $\theta a \pi \tau - \omega$ ; and indeed a suffix er or el is well known in our own language as in quiver, shiver from quake, shake, gambol and gamble from game. But as to the root-syllables ap and op, my first thought was directed towards ab 'from' and ob 'to,' for 'opening' is separation and 'shutting' is re-union, and indeed we ourselves have the phrase 'put to,' in the sense of 'shut.' The other alternative was to look out for prepositions signifying 'up' and 'down,' which would correspond to our phrases 'put the window up' and 'put it down.' Now our own verbs ope and open, the Germ. offen and öffnen, the Dutch open and openen connect themselves beyond a doubt with the several prepositions up, auf, and op, to say nothing of such a word as the German aufmachen 'to open.' But where am I to find op 'down' for 'op-eri-'? I answer, in the ob of occid- 'fall down,' 'die,' 'set as the sun,' occid-'cut down,' oppet- and obi- 'go down,' i.e. 'die,' occuba- 'lie dead,' obter- 'tread down,' opprim-'press down.' The Sanskrit gives this prefix in the shape ava 'down,' and the Latin also has it in the ab 'down' of abici- (abiecto-) 'throw down,' ab-sorbe-'suck down,' afflig- 'dash down,' appos- (appon-)

'set down.' The German too has this very form with the sense of down in several words, especially in her-ab, hin-ab, and ab-wärts 'downward.' I am not blind to the fact that on this theory op-eri might as well have signified 'to open,' and aperi- 'to shut.' But language is somewhat arbitrary and uncertain in such matters.

The adverb perendie is sometimes spoken of as a hybrid word, made up of the Latin die and the Greek περαν, or Sansk. param; but here again, without denying the identity of the three words, περαν, param, and peren, I would claim the last as a native and a corruption of superen, whence the adverb supern-ĕ 'from above' (with a suffix like ind-e, und-e, and the Greek  $o\pi\iota\sigma\theta$ - $\epsilon$ , &c.) so that perendie shall correspond in its first element to the über in über-morgen of precisely the same meaning. This theoretic peren or peran exists, though a little disguised, in the contracted form tran. Before an r the Latin language was much given to a change of consonant. Thus trem-ere, as has been often noticed. is a corruption of cremere (Fr. craindre and Old Fr. cremir). A thoroughly parallel example to our theory about trans is seen in the adjective tranquillus for planquillus, a double dim. of plancus, as that again is a dim. of planus. The verbs trādo, trāduco, trāicio seem formed from tran rather than trans; and the co-existence of two forms, one with, one without an s, is seen in many of the prepositions, as ab, sub, ob, ec, di. It may be noticed too that this theory brings the French particle très 'very,' so commonly used with adjectives, into immediate connexion with the Latin per and Greek ὑπερ of the same habit. Even within the limits of the Latin language we have what is really identity in the two forms trans-fuga and perfuga 'deserter,' or more literally in German, überläufer.

In the Greek language I would first observe that certain compounds with the full form ὑπερ present peculiar meanings which go far to support the doctrine that ver is a shorter form of über, viz. ὑπεροραω ύπεριδειν 'overlook,' and ύπεροπτος 'slighted' compared with versehen, overlook, and verachten. Indeed, the simple verb achten 'to look' is probably the analogue of the Greek  $o\pi\tau$ -o $\mu a\iota$ , for the  $\pi$  of this word appears as a c in the Latin oc-ulus, while ac itself is seen in the Lith. ak-i-s, as also in ac-tutu-m 'in the twinkling of an eye,' 'in einem augenblicke,' to adopt Dr. Ebel's explanation of the word (Kuhn's Zeitschrift, iv. 320); and then a c in Latin should be represented by ch in German, while the o again should give place to an a. In both acht and  $o\pi\tau$  the t I regard as excrescent. Again, in ύπεραγωνιζομαι, ύπερμαχομαι, ύπεραλγεω, ύπεραγρυπνεω 'fight, &c. for' —, we have an explanation of the ver in verfechten and vertheidigen; and above all ὑπερ-αποκριν-ομαι 'answer for' corresponds with all accuracy to ver-antworten. Then again, the negative power of ver, though in itself it means 'über,' is in agreement with the use of ὑπερκαιρος 'over or beyond the time,' hence 'at wrong times,' like akaipos —to quote the words of the Lexicon.

But the Greek also seems to have a decapitated variety:  $\pi a \rho$  for  $i\pi \epsilon \rho$ , or  $\pi a \rho a$  for  $i\pi a \rho a$ ; for I cannot but think that language was in possession of two distinct words  $\pi a \rho a$ , which have accidentally taken the same form. From the words in which  $\pi a \rho a$  means

'presence,' or 'by the side of,' I would separate those in which is to be found the idea of 'over,' or 'what is wrong,' or 'negation.' No doubt there are cases where 'passing by' and 'passing over' afford equally good explanations of the excessive. But to παραπηδα-'leap over' and so 'transgress,' and παρ-ορίζ-, alike in the sense of 'outstepping one's own boundaries,' or 'driving another over them into banishment,' the notion of over seems alone applicable. So with παραιρε-when used either of 'transferring a curse,' or 'drawing over to one's own side.' The verb παραφημι may well mean 'persuade,' if it have for its literal translation 'to talk over,' 'über-reden.' The same applies to παραπειθω. In παραδιδωμι and παραλαμβανω, παρα 'over' is suited to denote a transference of property, like trans in the Latin trado. Then in not a few words the notion of covering is added by  $\pi \alpha \rho a$ , which suits well, if this be a variety of ὑπερ, as παρακαλυπτ-, and, what is probably the same word at bottom, παρακρυπτ-, παραλειφ-, παραμπεχ-, παραπεταλο- 'covered with plates (of silver, &c.),' παραπεταννυ-, παραπηλωτο-'besmeared with mud,' παραπωμαζ- 'cover with a lid,' παρασκηνο- παρασπιζ-, παραχρι-. So, too, παραφυλασσwill bear the translation 'watch over,'  $\pi a \rho o \nu \rho o$ - that of 'one who watches over.' Again I cannot but give the preference to  $\pi a \rho a = \ddot{u}ber$  over  $\pi a \rho a$  'by the side of,' in such cases as  $\pi a \rho a \nu \theta \epsilon$ — 'verblühen,'  $\pi a \rho a \gamma \eta \rho a$ -,  $\pi$ αρακμαζ-,  $\pi$ αρηβα-,  $\pi$ αρηλικ-, compared with  $verj\ddot{a}hren$ , veralten, the Ang.-Sax. ofer-geare, ofer-eald, and our own superannuated. So also παραβλεπ- παρορα- must go with Horace's peruide-, with the German übersehen and versehen of like meaning, Ang.-Sax. for-seon 'despise' and our own overlook. Here indeed something is to be said for those who find the explanation in 'looking by the side of;' but when we come to the sense of hearing the explanation fails. Still there can be no doubt that we must class παρακου- and παρακροα- (r.) 'hear wrong,' or 'fail to listen to,' with the German verbs über-hören, verhören (sich), and the Ang.-Sax. ofer-heoran or ofer-hyran, all of like meaning. Then the adjectives παραθερμο- 'overhot, παρατολμο- 'foolhardy,' παραυστηρο- 'exceedingly austere' (I take the translations from L. and S.), are at one with the German überlang and Greek ὑπερλαμ- $\pi\rho$ ο- &c. while  $\pi a\rho\omega\rho$ ο- corresponds to  $\dot{\nu}\pi\epsilon\rho\kappa a\nu\rho$ ο-. To these I add two rare words, which alike seem to show that παρα is a corruption of ὑπαρα, viz. 'παραπαγος (or παρπαγοs) the upper bolt of a door (Hesych), and mapaseiov 'a topsail' = Lat. supparum. As to σειον of παρασειον, I would suggest the possibility of its having supplanted a fuller σεχ-ιον, which as a dimin. of a form  $\sigma \in \chi$ , would correspond to the German seg-el, our sail; and, on the other hand, the word supparum (there is also a reading siparum with a single p) seems to confirm the argument that mapa of mapaseiov is, as elsewhere, a corruption of a fuller ὑπαρα.

A form  $\sigma \epsilon \chi$  is commonly assumed as the base of  $\epsilon \chi - \omega$ ; and, again, the Latin ueh-o must be one with  $\epsilon \chi - \omega$ , as shown by the meaning of the derivatives  $o\chi - \epsilon \sigma$ - (cf. the Homeric  $o\chi \epsilon \sigma - \phi \iota \nu$ ), and  $o\chi o$ - 'a vehicle.' But a sail is the chief instrument in the movement of a ship. Hence  $u\bar{e}lum$ , i.e. uek-el-um (cf. for the guttural uexillum, and pauci, paulum, pauxillum), the German seg-el and the theoretic  $\sigma \epsilon \chi$ - $\iota o \nu$  will be all diminutives from a common root. The appearance of a  $\sigma$  by the side of a u is not to be explained by any interchange

between two sounds so utterly unlike. We should rather start from a base  $\sigma o \chi$ , which, when followed by a weak vowel (*i* or *e*), would give way to the 'umgelautet' swech, and so to wech or ueh.

With this evidence before me of the close connexion between  $\pi a \rho a$  and the prepositions  $i\pi \epsilon \rho$ , iiber, and ver, I am strongly of opinion that we should in all the cases where the notion of wrong or negation lies in the prefix  $\pi a \rho a$ , claim it as a totally different word from  $\pi a \rho a$  'by the side of.'

But I must return for a short time to the Teutonic family of languages, to say a few words on a Norse prefix which seems to be allied to those which we have been discussing, viz. of, in the sense of too much, as given in Rask's Grammar (§ 302), viz. in of-mikill 'too much,' of-gamall 'too old,' of-snemma 'too soon, of-seint 'too late, of-ät 'gluttony, of-dryckja 'drunkenness.' Here all would have been intelligible, if instead of the simple of we had had some comparative as ofer, for then we should have had forms corresponding to the Ang.-Sax. ofer-eatan 'to overeat' and ofer-etol 'a glutton,' &c. Possibly the explanation may be that, in accordance with the law that irregular comparatives, just because of that irregularity, are permitted to drop the final suffix, for example bet, mo, leng, less, of our own language, in place of better, more, longer, lesser; ma (mālo), sat, aut, in Latin, in place of magis, satis, alterum, so this Norse of may be a curtailed variety of ofer. This would serve to justify the use of of-tyened 'very angry,' and of-guoing 'transgression' (The 'Ayenbite of Inwyt,' pp. 66 and 215). But for the case of of-take (p. 104), I have already provided in another way.

In dealing with a German particle, I have the feeling that I am an intruder, and the more so as my knowledge of the language is a very loose one. the same time an outsider is often alive to difficulties which never present themselves to a native, for the simple reason that a mother tongue is acquired without much exercise of the reasoning powers. It is probably due to this cause that there are so few good grammars of any modern language. At any rate in my own case it was the inability to find satisfactory explanations of the inseparable prefixes of German that induced me at different times to look with some care into the facts as presented by dictionaries, and then to connect such words with the equivalent forms of the kindred languages. It is in this way that I have dealt with the inseparable prefixes ent, unter, er, zer, and ver, and their representatives. I do not expect my views to be blindly accepted. It will be enough if I stir up an intelligent inquiry into the subject on the part of those who are better qualified to deal with it.

## V.

## Post AND after THE SAME WORD.

My first sketch of this paper, as it was drawn to be read before the Philological Society, I wrote without any knowledge of what Ritschl (Rhein. Mus. n. f. vii. 573) and G. Curtius (Kuhn's Zeitschrift, i. 268) had said before me. Where our views agree I find much in their testimony to strengthen my argument; and where we differ I will give my reasons for the difference.

I begin with the assertion that in both these words, post and after, the letter t is excrescent (see my paper on this subject below); in other words, that the more genuine, or, as the Germans say, the more organic forms are pos and afer.

As regards the assumed pos, I first pointed to the old dactylic inscription (Mommsen's CIL. 1454): 'Qúr petis postémpus <sup>1</sup> consílium; quód rogas nón est;' to another inscription (Orelli-Henzen, 6561) '...lib. libertabus posrisq. (= posterisque) eorum;' to the Umbrian pustertiu of the Iguvian Table (1 b. 40, Huschke); and to the phrase pus-ueres of the same

<sup>&</sup>lt;sup>1</sup> In the instances postempus, pustertiu, posterganeus, postu, postemplum, the t might have been supposed to be performing double duty but for the abundant examples where the word following postegins with other letters.

(1a. lines 7, 14, and 24), opposed to pre-ueres (lines 11 and 20), which are respectively translated 'post portas or muros' and 'ante p. or m.;' to the adjective posterganeus of late writers; to what Velius Longus (2237, 13 P.) quotes from Cicero's Orator (43): 'posmeridianas quoque quadrigas libentius dixerim quam postmeridianas' (for which last word Ritschl, I now find, suggests the substitution of pomeridianas); to pomerium and pomeridianus, as naturally growing out of posmerium and posmeridianus, just as remus stands for resmus, and Camena for Casmena; to posquam, as given by one of the most trustworthy MSS. of Catullus (xi. 23), and adopted by Bergk; to pos legem and pos te, said by Diez (Gr. iii. 215) to occur in the Agrimensores; and lastly, to pone, as standing for pos-ne, and so receiving its best explanation. Cf.  $p\bar{o}no$  for posno, the root pos alone appearing in posui, positus, while the n of the imperfect tenses performs the same office as in sterno, cerno, sperno; for I unhesitatingly reject the theory which would make pono a compound of sino. The old form posiui seems at first to support this view; but compare quaero quaesiui, peto petiui. In fact it is common for consonant-verbs and i.-verbs to coexist, and then interchange their tenses, as in uenio ueni, farcio farsi.

To this evidence I now add from the MSS. of Plautus, as pointed out by Ritschl (l. c.), 1, posquam, Glor. 124, CDa; 2, posquam, Bac. 277, Ba; 3, pesquam (for posquam), Poen. Pr. 104, BCD; 4, poshac, Poen. i. 2, 66; 5, postu (= post tu), Trin. 975, BC; and then in abbreviated form with the symbol p', which he with reason interprets as = pos (or perhaps pus?); 6, p'quam, Glor. 121, B; 7, p'id (for pos id),

Trin. 529, D; 8, p'hunc, Men. i. 2, 3, C; 9, p'qui (where other MSS. have postquam), Glor. 1331, Da; 10, Pquam (with the mark 'accidentally omitted, he thinks), Pseud. 1,269, C; 11, p. illa (with two letters erased), Men. v. 9, 58, Ba (p'illac Bb); and then from other sources, for which also I am indebted to Ritschl, 12, postemplum, and 13, poscolu[mnam], Iscr. Marini Atti, &c., 182 and 258; 14, pusmeridianae, Cic. Att. xii. 53, Med. MS.; 15, posquam res Asiae, ap. Marium Victorinum, 2,467, Putsch.

That pos rather than post is the older form is further confirmed by the Sanskrit paç-cat 'post,' and the S. adj. paç-cha 'after-coming,' with its superl. paç-ch-ima; as also by the Lith. pas-kuy 'postea,' and Old Prus. pans-dau of like meaning (Pott. E. F. i. 88, and Bopp's Gl.). Part of this I take from Curtius (l. c.).

Hence I confidently assume that the t of post is excrescent, as in the Germ. morast, our morass, Fr. marais, Germ. palast, Fr. palais; or, to draw examples from the classical languages, ost-ium by the side of os oris, and οστ-εον by the side of os ossis.

Our preposition after, and the Gothic aftra, Bopp (V. G. § 295, vol. ii. p. 28 of the second edition) would divide so as to attach the t to the suffix, as af-ter; and on the same principle he places the hyphen before the dental in the Old Germ. prepositions or adverbs, wi-dar, ni-dar, hin-tar, sun-dar, for-dar. But that such a proceeding is erroneous is proved by the form of our simpler words aft (ab-aft), with, neath (be-neath), hind (be-hind), and forth. Had our adjective yonder fallen under his view, he would no doubt in all consistency have divided it yon-der; but here again we once had a simple yond as well as yon, and still have be-yond.

Of course he is thus driven to erroneous results. For example, his division of the Gothic wi-dar, Germ. wi-der, calls for some explanation of the first syllable; and accordingly he finds this in the Sanskrit particle vi, which denotes, he says, 'separation' ('trennung'). Had he thought of the identity of the English verb with-stand, and the German wider-stehen, widerstand, he would probably have admitted that wid, Eng. with, is the root-syllable, with the meaning of 'union' instead of 'separation;' for though union often includes the idea of peace and friendship, a meeting may also be preparatory to hostile proceedings. Tecum coniungi generally implies an amicable union, but then we have also tecum pugnare as well as congredi, and conferre A thoroughly parallel case is seen in the Latin contra and its primitive con or cum, two words which render it impossible to doubt the connexion of wider with our with; and though contra very often carries with it the idea of hostility, yet such is certainly not the case with the Fr. contre-danse, and our English equivalent but misspelt country-dance, where the parties are brought indeed face to face, but not for war.

The Gothic aft-ana, too, compared with ut-ana, &c. goes far to prove that the t belongs to the first syllable. Accordingly, as Bopp himself remarks, Grimm gave a preference to the division aft-uma for the Gothic superlative. In a subsequent paper I hope to show that generally er rather than ter or ther is the suffix of comparatives, thus giving a preference to what is seen in ev-epoi, sup-eri, inf-eri, and making the division  $\sigma o \phi \omega \tau$ - $e \rho o s$ ,  $\beta e \lambda \tau$ - $e \rho o s$ ;  $e \tau$ - $e \rho o s$ , alt-e r, oth-e r;  $\pi o \tau$ - $e \rho o s$ , ut-e r, wheth-e r.

For the present purpose I have still more valuable evidence: first, in the Gothic forms afar and afara; secondly, in the Sanskrit apara 'posterior,' and the Vedic apama 'postremus.'

But I am also called upon to justify the assumption that an f in our Teutonic family has a tendency to throw out a t; and I give as examples, left by the side of the Latin laeuus, the Germ. saft compared with our sap, the English sift in connexion with the noun sieve, and our adverbial aloft and the Germ. noun luft, so closely allied to the nautical verb luff or loof. The adverb often also is so commonly pronounced without any regard to the t, that one is tempted to conclude that an earlier form was of-en. As s of the Latin sub is lost in our up, so subinde (see p. 71), or rather supinde, may be one with our often, as it is one with the Fr. souvent.

It was from a belief in the excrescent character of the t in aft that I was led to identify the root-syllable af with the Latin ob, and the Greek  $\epsilon\pi\iota$ . The b of ob, as of sub and ab, is proved to have supplanted a p by the Greek equivalents, and also by such derived forms as superi, supra. Thus the f in aft obeys Rask's law, while the vowel change between ob and af corresponds with what is seen in domare and our tame, Germ.  $z\ddot{a}hm$ -en; in rogare and Germ. fragen; collum and hals; rota and rad; folles and balgen.

I next revert to the doctrine so often put forward already (p. 57, &c.), that prepositions which begin with a consonant have often attained this form by the loss of a preceding vowel, and that such lost vowel is either one with or akin to that which follows the said consonant. On this principle pos suggests the form

opos; and we have a parallel case in the noun pomum as having grown out of an older opomum. (See paper on 'a privative.') This assumption of an initial o seems fully justified by the form οπισω (οπισσω) with the very meaning one would desire; the more so that the opposed word προσω (προσσω), i.e. πορ-οσ-ω, tells us that οπ alone belongs to the root, while aν-ω and κατ-ω also compel us to mark off the ω of οπισ-ω and προσ-ω, as in itself a suffix.

Now the form op-os thus placed beyond doubt bears so strong a likeness to our English theoretic af-er, allowing for the usual letter-changes, that it may well raise the suspicion that they are virtually the same word. The ordinary suffix of the Latin comparative is of course ior, but this we know grew out of an older ios, the neuter, as melius, and the diminutive, as meliusculus, still retaining the original s. But of this suffix ios one or other vowel is apt to disappear (cf. Bopp's V. G. § 303). In minor, minus (for minior, &c.), and secus (for secius 'other'), the weak vowel is lost, but the o in magis and meyiotos (for meyiotos), in nimis and satis, and in pris of pristinus. In this last word we have again an excrescent t, just as we have in crastinus from cras; and the pris stands for prius, being one with the Greek πρῖν (of Homer) for πριον. Looking then from this point of view, we find a comparative which has lost the weak vowel in our theoretic op-os of the Latin, and one which has lost the strong vowel in  $o\pi$ - $\iota\sigma$ - of the Greek. Nay, the preposition mpos itself, i.e.  $\pi o \rho$ -os, must also be of comparatival form.

The doctrine that the os of pos (op-os) is of comparatival character seems confirmed by the old Prussian pans-dau, for ans is so far nearer to the Sanskrit suffix

yans of comparatives. It is also to be observed that the o of the form pos is long, as in a comparatival form it is entitled to be. This appears from two of the passages to which Ritschl refers, viz.—

'Hanc equidem Venerém uenerabor, mé [ut] amet pōshac própitia.'—Poen. i. 2, 66.

And the line of Cretics:-

'Práeterhac sí mihi tále pōs húnc diem.'—Men. i. 2, 3.

And I venture to add yet a third from among those he brings forward, viz. :—

'Néque patrem umquam pōsilla (usquam ?) úidi. M. Quid uos túm patri,' &c.

Here the first four words (posilla or postilla) are given in the order of all the MSS., and hence we may safely infer that the metrical accent fell on pos. I have inserted usquam on conjecture, as the lost word must have begun with a vowel. Ritschl's correction is more violent when he transfers umquam to the fourth place, and changes postilla into postillac.

The appearance of a short vowel in the Greek form  $\Pi o\sigma\tau o\nu\mu\iota os$  for Postumius, which seems to have influenced Ritschl in his view that pos has a short o, deserves, I think, to have no more weight than Plutarch's transliteration of the Latin  $deci\bar{e}s$  (deciens) by  $\delta\epsilon\kappa\iota\epsilon s$ .

But the appearance sometimes of is, sometimes of os, in the Latin comparative, has its counterpart in the Teutonic family. Thus the Gothic has comparatives ald-iz-a 'older,' minn-iz-a 'less,' &c., and also frum-ōz-a 'former,' frod-ōz-a 'prudentior,' &c. So again in Old German we find in abundance such forms as alt-ir-o or alt-er-o, menn-ir-o or menn-er-o; and on the other hand jung-ōr-o 'younger,' and frot-ōr-o corresponding to the Gothic frod-ōz-a, &c. And, to

complete the resemblance to the Latin forms, the comparatives in i (e) have a short vowel, while the o is always long. Of course the er of the Modern German, as  $\ddot{a}lt-er$ , must be of the same origin of the corresponding syllable in alt-ir-o or alt-er-o. Hence if we apply to the Teutonic family what has been said of Latin, the iz and oz of ald-iz-a frum-oz-a have in all probability grown out of an older ioz; but the form iz is substantially the same as the ir or er of Old German and the er of Modern German. Consequently the er of after is not merely of the same power, but also one in origin with the  $\bar{o}s$  of  $p\bar{o}s$  ( $op-\bar{o}s$ ).

Thus the proposition with which I started, I venture to say has been established. But a few more last words

may be permitted.

It may be as well to note once more the habit of prepositions to take a comparatival suffix, in which case the secondary form not unfrequently supplants the original simpler word. Thus with ourselves near (for nigh-er) is in more frequent use than nigh. In this way I would account for the fact that ob lost the signification of 'after,' which its Greek representative  $\epsilon\pi\iota$  long retained, as for example in  $\epsilon\pi\iota\gamma\rho\nu\rho\sigma$ .

I gather from G. Curtius (l.c.) that Aufrecht considers the Sanskrit pas 'post' as decapitated from apas, to which I so far of course assent; but when they connect this assumed apas with the Sanskrit apa and Greek  $a\pi o$  I cannot but differ from them; and I am no way surprised that Curtius, holding this view, hesitates to connect with this family of words the Lithuanian pas 'prope.' But all difficulty on this head disappears when  $\epsilon\pi \iota$  and ab are substituted for  $a\pi o$  and ab

It may be observed as not improbable that the Fr. puis, It. poi, Span. pues, together with the compounds depuis, dopo, despues, owe the non-appearance of the t, not to any aphaeresis of that letter, but to the fact that they came directly from the true form pos. The Italian has also the compound forms posdomani, posporre, postergare, posvedere.

I would further remark that Ritschl's theory which treats post as a curtailment of poste, and which regards the d of postidea and antidea as inserted for the purpose of avoiding hiatus (hiatus-tilgende) as in both respects questionable. I should rather be disposed to look upon post-id and ant-id as derivatives from simpler prepositions, which passed ultimately into the forms poste and ante. This suffix id may perhaps be one with the ed of red (for er-ed), of which I spoke in the paper on re and pro. Thus post-id would correspond to r-ed, post-e to re (er-e). Of course in this view post is no longer a curtailed poste.

In speaking above of the law of letter-change which holds between the mute consonants of the classical and Teutonic languages, I have thought it right to use the name of Rask rather than that of Grimm, having before me Bopp's note (§ 87, or vol. i. p. 119 of the ed. 1857), which it will be well to translate at length, as the whole credit of the discovery is still for the most part unduly assigned to Grimm. Bopp's words run thus:—

'In my former treatment of this matter (1st ed. p. 78, fol.) it had escaped my notice that Rask, in his prize essay, "Undersögelse om det gamle Nordiske eller Islandske Sprogs Oprindelse" (Kopenhagen, 1818), had clearly and conclusively put forward the law here

given, which indeed it would have been difficult to overlook. A translation of the most interesting portion of Rask's paper was also given by Vater in his "Comparative Tables of the European Family of Languages." Rask's discovery, however, must be so far qualified that he deals only with the relation between the northern and classical languages, so as to take no notice of the second law of interchange as exhibited in German, which was first demonstrated by Grimm. Rask's law (p. 12 of Vater's work) is that among the mute consonants the following changes are especially common:—

<sup>&#</sup>x27;  $\pi$  to f, as:  $\pi$ aτ $\eta$  $\rho$ , fadir.

<sup>&#</sup>x27;τ to th, as: τρείς, thrir; tego, eg thek; τύ, tu, thú.

<sup>&#</sup>x27;κ to h, as: κρέας, hra (a corpse); cornu, horn; cutis, hud.

<sup>&#</sup>x27; β is often retained: βλαστάνω (sprout), blad; βρύω (well), brunnr (a spring of water); bullare, at bulla.

<sup>&#</sup>x27;δ to t: δαμάω, tamr (tame).

<sup>&#</sup>x27;γ to k: γυνή, kona; γένος, kyn or kin; gena, kinn; aγρος, akr.

<sup>&#</sup>x27; φ to b: φηγός,  $b\ddot{o}g$  (beech), fiber bifr; φέρω, fero,  $eg\ ber$ .

<sup>&#</sup>x27;  $\theta$  to d:  $\theta$ ύρη, dyr.

<sup>&#</sup>x27;χ to  $g: \chi \acute{\nu} ω, gyder (gush)$ ; έχειν, ega; χύτρ $a, gr\acute{y}ta$ ; χολή, gali.'

## VI.

#### ON THE SO-CALLED & PRIVATIVE.

The old doctrine which treats a mere vowel  $\alpha$  as the original form of this prefix, the  $\nu$  being an epenthetic consonant, still maintains itself in some quarters. Thus in a Sanskrit Grammar published at Oxford not long ago, the form a is assigned to the prefix with the qualifying remark that 'when a word begins with a vowel, an is usually substituted.' Perhaps it is to such words as αεικης 'unseemly,' αυπνος 'sleepless,' αωρος 'untimely,' that the false explanation owes its vitality; but the lost initial digamma or  $\sigma$ , or asperate, accounts for these anomalies, the older forms having been α Feiκηs, ασυπνος, α-ώρος (see Proc. Philolog. Soc. iii. 52, &c.). Again, the original av accounts satisfactorily for the long vowel of  $\bar{a}$ - $\theta a \nu a \tau o s$ , and for the  $\mu$  of  $a \mu$ - $\beta \rho o \tau o s$ . But the strongest argument in favour of  $a\nu$ , as against the claim of a mere a, is seen in the prevalence for the most part of a nasal in the corresponding prefixes of allied languages; as-

Lat. Sansk. Gael. Welsh. Gothic, &c. Dutch. Old Norse. Swed. Dan. in an ana, an, am an un on o o u

It may be as well to add that the '&c.' attached to the heading 'Gothic' must be interpreted as including German of all ages, Old Saxon, Anglo-Saxon, and of course our own language.

So much for the final letter of the prefix. question whether the word once possessed a still fuller form will be considered presently. The next question is as to the meaning of the little particle. Our Greek lexicons assign to it not a few meanings. But no one probably will claim as of one origin the prefix with negative power, and that which signifies unity, or something like it. Aloxos, anoitis, askelns = isoskelns, &c. have in all probability a common prefix with άπλους; in other words, have lost an initial asperate. Those, then, may be thrown aside. Then again, it is perhaps nearer the truth to regard the forms αστεροπη, ασταφιε, ασταχυε, as more genuine than the familiar στεροπη, σταφιε, σταχυε, instead of giving precedence to the shorter form, and calling the a a euphonic But in either case, the a of such words has no connexion with the prefix which is under consideration.

I have next before me the claim of the so-called a emination, or intensive alpha. It has often been said that the Greek grammarians gave an undue extension to this particle, and indeed it has been objected to them that some of the examples which they quote are but inventions of their own. That they were guilty of such a deliberate offence is altogether unlikely. I hope presently to show that a prefix with the sense of intensity, one in form with the negative particle, and, as I believe, one in origin with it, was in extensive use in some members of the Indo-European family of languages; and if this be admitted, then it will be rather matter of surprise that the Greek language has

so few claimants for the meaning. No doubt it was found to be a serious inconvenience that a language should have compounds with the same prefix bearing two meanings at first sight so inconsistent as negation and intensity. An ambiguity of this kind is pretty certain to be got rid of by the disappearance of one or both meanings. Still I must contend that in the Homeric forms askedes and asmepyes the a may well have added to the words the notion of intensity. so however with the adjective arevns, which maintains its position down to a late period in Grecian literature. This word seems to me to be only a variety of evtenns, and so immediately connected with the familiar verb εντεινω; and I would justify the change of form by the tendency of the Greek tongue to drop an  $\nu$ , especially before a dental, at the same time changing a preceding  $\epsilon$  to  $\alpha$ . Thus the very verb  $\tau \epsilon \iota \nu \omega$   $(\tau \epsilon \nu)$ exhibits the change in its tenses εταθην, τετακα, τεταμαι, so βενθος, πενθος coexist with βαθος, παθος; and generally men, the termination of Latin substantives, is represented in the Greek vocabulary by  $\mu a \tau$  or  $\mu a$ .

As it was in the Gaelic language that I was first led to the conclusions which will appear in this paper, and as that language still furnishes, I believe, the most abundant as well as the most decisive evidence in the matter, I propose to give in some detail what is there found bearing on the subject. But before doing so, it will be convenient that I should state the theory by which the two apparently irreconcilable ideas of negation and intensity are brought into harmony. I would assign then male as the primitive idea of the prefix, the influence of which is most opposite, according as it is attached to an idea desirable or not desirable.

While male sanus can only mean 'unsound,' male turpis is an equivalent to turpissimus. This latter use of male has been well noted by Orelli (Hor. Carm. i. 17, 25), in the phrase, Ne male dispari incontinentes iniciat manus, where he quotes the parallel cases, male laxus calceus, Hor. Ep. i. 3, 31; oculis male lippus inunctis, Sat. i. 3, 25; insulsa male et molesta, Catul. x. 33; male inepta, Tibul. iv. 10, 2; adding the just qualification, Homonymum est vv. 'valde, admodum' cum vocabulo ingratae qualitatis. There are of course words which in themselves are neither eulogistic nor dyslogistic. These however take their colour from the context. Thus, as Orelli again writes, male pertinax has the negative power in the digito male pertinaci of Horace (Carm. i. 9, 24), because firmness was then to have been desired, but not so in Prudentius (Cathem. Praef. 14), Male pertinax Vincendi studium subiacuit casibus asperis.

The fact that the so-called privative particle sometimes implied blame has of course attracted notice; but the explanation commonly given, though in itself thoroughly intelligible, seems to me to be ill founded; ' $A\beta ov\lambda ia = \delta v\sigma \beta ov\lambda ia$ , ill-counsel, and  $a\pi\rho i\sigma \omega \pi os$ , ill-faced, ugly,' say Liddell and Scott, are 'strictly a hyperbole, counsel that is no counsel, i.e. bad, a face no better than none, i.e. ugly.' The issue, I think, will be that this explanation is untenable.

I now proceed to the quotation of examples from the Gaelic Dictionary of the Highland Society of Scotland, omitting for brevity those words where the negative notion prevails. It should be noticed, however, that in the words now to be given the editor sometimes gives to the prefix the epithet 'intensive;' sometimes, pursuing a course which he finds more convenient, omits all epithets, and confines himself to the safe phrase, 'a prefix.' The compound words then, in the order in which the dictionary presents them, are—

- \* aimfheoil 'proud flesh' (feòil 'flesh').
  aimhreit 'discord' (réit 'harmony').
  aimhriochd 'disguise' (riochd 'form'); also
  ainriochd 'pitiful, or unseemly appearance.'
- \* ainbheus 'immorality' (beus 'habit').
- † ainbhfheirg 'rage' (fearg 'anger').
  aincheist 'doubt' (ceist 'anxiety').
  aindealbh 'unseemly figure' (dealbh 'form').
  aindlighe 'unjust law, trespass' (dlighe 'law').
- \* aineachd 'misapplied prowess' (eùchd 'feat').
- 10 † aineogail 'astonishment' (eagal 'fear').
  - † ainghean 'excessive love' (gean 'love').
    ainghearrahd 'a short cut' (gearradh 'a cut').
  - † ainiarmartach 'most furious' (iarmartach 'furious').
  - † ainiomad 'too much' (iomad 'much').
    ainlean 'to persecute' (lean 'to follow').
    ainmheas 'ostentation' (meas 'valuation').
  - † ainneart 'violence' (neart 'strength'). ainnis 'poverty' (éis 'want').
  - \* ainsgean 'bad temper' (gean 'mood').
- 20 ainteann 'constrictus' (teann 'tense, stiff').
  - \* ainteist 'false witness, bad character' (teist 'testimony, character').
  - † ainteas 'excessive heat' (teas 'heat').
  - \* aintighearn 'tyrant' (tighearn 'lord').
  - † aintreun 'ungovernable' (treun 'brave').
  - \* amhfhortan 'misfortune' (fortan 'fortune').

amhsgaoileadh 'diarrhoea' (sgaoileadh 'scattering').

amlubach 'curling' (lùb 'curve').
anabarr 'excess' (bàrr 'excess').

anabeachdail 'haughty' (beachdail 'observant').

30 \* anablas 'bad taste' (blas 'taste').

anabraise 'immoderate keenness' (brais 'keenness').

anabuirt 'madness' (burt 'ridicule').

- \* anacainnt 'ill language' (cainnt 'speech').
- \* anacaith 'misspend' (caith 'spend').

  anaceist 'difficulty' (ceist 'anxiety'). Another

  variety of this word occurs below.
- \* anacleachdadh 'bad custom' (cleachdadh 'custom').
- \* anacleas 'a bad deed' (cleas 'a deed').
- \* anacradh 'object of pity' (cradh 'pity').
- \* anacriosd 'antichrist' (Criosd 'Christ').
- 40 † anacruas 'avarice' (cruas 'hardness').

  anacuibheas 'immensity' (cuibheas 'enough').

  anacuimse 'immensity' (cuimse 'measure').
  - † anacūram 'excessive care' (cūram 'care').
    anaghlas 'milk and water' (glas 'grey').
  - † anaghlaodh 'loud shout' (ylaodh 'call'). anaghleus 'disorder' (gleus 'order').
  - \* anaghlòir 'ill language' (glòir 'speech').

    anaghlonnach 'renowned for valour' (glonn
    'deed of valour').
  - \* anaghnàth 'an ill habit' (gnàth 'custom').
- 50 \* anagrach 'litigious' (agarrach 'claiming').
  - † anagràdh 'doating love' (gràdh 'love'). anaimsir 'unmeet time' (aimsir 'time'). anairc 'necessity' (airc 'want').

andm 'unseasonable time' (àm 'time').

- \* anamharus 'wrong suspicion' (amharus 'doubt').
- \* anamhiann 'lust' (miann 'desire').

  anàrd 'very high' (àrd 'high').

  anbhas 'a sudden death' (bàs 'death').

  anbhàthadh 'a deluge' (bàthadh 'drowning').
- 60 † anbhorb 'furious' (borb 'fierce').
  anbhroid 'tyranny' (bruid 'a thorn').
  - \* andàn 'foolhardy' (dàn 'bold').

    andéistinn 'squeamishness' (déistinn 'disgust').
  - † andôchasach 'presumptuous' (dôchasach 'hopeful').
  - \* andòigh 'bad state' (dòigh 'condition').
  - † andòlas 'excessive sadness' (dòlas 'woe'). anduine 'wicked man' (duine 'man'). aneanraisd 'a storm' (aonrais 'tempest').
  - † anfhad 'too long' (fada 'long').
- 70 anfhann 'weak, feeble' (fann 'weak').
  - \* anfhlath 'tyrant' (flath 'prince').
  - \* anfhocal 'reproach' (focal 'word').
    anfhosgladh 'chasm' (fosgladh 'opening').
  - † anfhuachd 'excessive cold' (fuachd 'cold').
  - \* aniarrtus 'wrong desire' (iarrtus 'petition').

    aniul 'bad guidance' (iul 'guidance').

    anlaoch 'exasperated warrior' (laoch 'hero').
  - † anluchdaich 'overload' (luchd 'load'). anmhurrach 'valiant' (murrach 'able').
- 80 \* annspioradh 'a devil' (spiorad 'spirit').
  anobair 'idle work' (obair 'work').
  - † anrachd 'violent weeping' (rachd 'tears').
  - \* anriadh 'usury' (riadh 'interest').
  - \* anriar 'a wrong gratification' (riar 'pleasure').
  - \* ansannt 'avarice' (sannt 'desire').

ansaoghalta 'worldly' (saoghalta 'worldly'). ansgàineadh 'chasm' (sgàineadh 'bursting'). ansgairt 'loud cry' (sgairt 'loud cry'). antarruing 'strife' (tarruing 'drawing').

90 \* antogradh 'eriminal propensity' (togradh 'desire').

antoil 'self-will' (toil 'will').

antràth 'wrong season' (tràth 'season')

† antrom 'grievous' (trom 'heavy').

\* anuair 'evil hour, bad weather' (uair 'hour').

If we look to the meaning of these words, it readily appears that in those which are marked with an asterisk, neither negation nor mere intensity supplies what is required. It is true, that anaghleus 'disorder,' may be considered as the negation of gleus 'order,' and aimhreit 'discord,' as the negation of réit 'harmony.' But no such interpretation will account for ainbheus 'immorality,' beside beus 'habit,' or for and digh 'bad state,' beside doigh 'condition,' or an fhocal 'reproach,' beside focal 'word.' On the other hand, intensity seems rarely if ever to characterise the compounds, except where that intensity is in fact excess, in other words an evil, as in anfhad 'too long,' from fada 'long,' anfhuachd 'excessive cold,' from fuachd 'cold,' and generally in those examples to which † has been prefixed. There are indeed among the quoted examples some in which the assigned translation does not bring out the notion of badness, but these exceptions are probably to be referred to the inaccuracy of the translator, as aincheist 'doubt,' from ceist 'anxiety,' ainnis 'poverty,' from eis 'want,' anaghlonnach 'renowned for valour,' from

glonn 'deed of valour.' As regards the last, a reputation for valorous deeds, though acceptable enough to those in whose behalf those deeds are exhibited, excites a very different feeling in the sufferers. Thus, the Hindoo and Mahratta had more fear than love for one whom in the last century they designated the 'Daring in war.' Again, anard 'very high,' from ard 'high,' is not easy of interpretation to a member of the Alpine Club. But the Highlander was not of so romantic a disposition. He thought rather of the labour of ascent, and so to him every addition to the height of a place was an evil. In the same way, a mere fissure in the ground was of little moment, so long as an easy leap would clear it; but when it was both wide and deep, it was either dangerous to cross directly, or required a somewhat laborious circuit to turn it. Hence probably the suffix seen in anfhosgladh and ansgaineadh, both translated 'a chasm.' On the whole, then, it may perhaps be safely affirmed that few will read through the list of ninety-four words without coming to the conclusion that the notion of badness is distinctly marked in a large proportion, and that the same notion gives a thoroughly satisfactory solution of the cases where intensity is the favoured explanation; and thirdly, that even in the few cases where the idea of negation would also supply a reasonable explanation, the idea of badness is, to say the least, no less applicable. This being so, the only sound conclusion is, that the one idea which will explain all the cases is to be preferred; in other words, that the prefix an carries with it the notion of malus.

Hence we must invert the order of the meanings which, under the heading 'An, prefix,' the Gaelic Dic-

tionary above mentioned puts forward, viz.: '1. Privative.... 2. Intensive.... 3. It is frequently found' (says the lexicographer) 'having the same acceptation as the adjective "olc" or "droch," placed before its adjunct: pravitatem nonnunquam designat.' We have here indeed an error, not uncommon in lexicons, and in one view pardonable. No doubt ultimately the privative notion was the prevalent one; and what is most common seems at first sight to have the best claim to precedence. It is in this way that our Latin Grammars place the secondary verbs in are at the head of the series of conjugations, in disregard of the claims of the simpler conjugation called the third. The spirit of modern philology however requires that the order of time should be observed here as much as in geology.

On the varying forms of the prefix in the Gaelic tongue some notice will be taken below. It may be observed however that among them is amh, which also occurs as an adjective in the same language, and one of the meanings assigned to it is 'bad, naughty, pravus.' This meaning is given on the authority of the well known Gaelic scholar, Shaw. Now the Latin malus is at present, I believe, an isolated word. It begins too with a letter which always incurs my suspicion, as occupying an initial place to which a liquid is not entitled. Thus, if I also assume the law of similar vowels for this adjective, an older form would be am-alus, of which am alone would be radical, alus being a suffix just as in the Greek μεγαλη, όμ-αλος,  $\chi\theta\alpha\mu$ -alos,  $\dot{\alpha}\pi$ -alos. This view I first threw out as a loose conjecture; but it seemed even then to receive some confirmation from our own adjective evil, Germ. übel, which may well represent a Latin amal.

But what was so far doubtful I regard as transferred to the region of certainty, when it appears that an adjective *avol*, in the sense of 'bad,' was once known to the Provençal, Catalonian, Spanish, and Portuguese languages. It is to Diez's Dictionary of the Romance languages that I owe the knowledge of this. But, as my explanation of the word differs wholly from his, I think it due to him to state in English what he says:

'Avol, Prov. (adj. of one termination) "bad, wretched." The word also occurs in Old Catal. Span. and Port.: but is so rare that the statements as to its meaning fluctuate. Sanchez translates avol ome, in Berceo, by 'ladron,' but this with hesitation; Moraes translates the Port. word in Nobiliario (where moreover he exhibits a various reading avil) by "máo," i.e. "bad." In Prov. it is of very common occurrence, though now, as in the other languages, obsolete, and signifies the opposite of pros, Fr. preux. That the first syllable has the accent is shown by the contracted form aul, which stands to avol just as fréul to frévol: Seckendorf therefore is wrong when he writes avól. As regards derivation, a guess has been made at the Gr. ἀβουλήs, "disagreeable," but this does not satisfy the meaning. Ducange, on the authority of a document of the year 1411, notices a form advolus = advena, which is literally the Romance word. As the Span. cuerdo is abbreviated from cordatus, and the Prov. clin from clinatus, so advolus, avol might be abbreviated from advolatus, avolé. The fundamental notion was "hergeflogen," i.e. "homeless, foreign," and the complete word was often so used: Ceux qui estoient ainsi bannis . . . les appelloit-on avolez (Ducange, v. advoli); garce avolée, Théâtr. Fr. p.p. Michel

449. From this notion that above mentioned might easily proceed, just as in our *elend* 1, "peregrinus," 2, "miser." It is true that in this way an adj. of two terminations was to have been expected; but the word met with the same fate as frévol = frivolus, frivola.

This far-fetched etymology I think Diez himself would have been the first to reject, had it occurred to him that malus was a decapitated variety of an obsolete amalus, especially as the change from amol to avol agrees with the law which he himself lays down (Gr. i. p. 200), that a Prov. v corresponds to a Latin m. The same change is seen in evil, which in this respect stands to amal just as amn-is to Avon, as Damn-onii to Devon. Even the difference in the two vowels of evil is accounted for as soon as we call to mind that, as  $a\lambda$  of  $\mu\epsilon\gamma a\lambda\eta$  is a suffix of diminution, so the same office is performed in English by syllables which have a weak vowel attached to the l, viz. le, as in mick-le, litt-le; and of course a weak vowel in a suffix generally produces an 'umlaut' in a strong vowel of a root-syllable, evil rather than avil or avle. A further argument for connecting the two words is that, as in Prov. avol is reduced to aul, so our evil takes the form ill.

It may be objected to this view, as to the connexion of the prefix  $a\nu$  or amh with the theoretic amalus, that the more common form of the prefix is an, rather than am. This is true, but it is a special characteristic of the Latin language that it prefers the labial to the dental nasal. Still, in many roots which exhibit an interchange of m and n, it is difficult to say which form has the better claim to originality, as when we find

 $\chi\theta o\nu$ - of the Greek standing beside  $\chi a\mu a\iota$  and  $\chi\theta a\mu a\lambda os$ , and the Latin humus, humilis, and again the Greek Faν-ερ-  $(a\nu\eta\rho)$  with Latin hom-on-, and Italian uomo. Mem-or indeed of the Latin has in its first or root syllable what seems to have been originally men, as in the Greek  $\mu \epsilon \nu$ -os,  $\mu \epsilon$ - $\mu \nu$ - $\eta \mu a\iota$ . So again an n seems to have the better claim as between om of om-it- (omitto) and  $a\nu$  of  $a\nu\iota\eta\mu\iota$ .

The examples so abundantly quoted from the Gaelic might be supported by no little evidence from the other members of the Keltic stock; but I will confine myself to a few instances drawn from the Welsh, anngwres 'full of heat,' from gwres 'heat,' anngwyth 'wrathful,' from gwyth 'wrath,' where the intensive power seems to predominate; and anhap 'mischance, mishap,' from hap 'chance,' anlliw 'a stain,' from lliw 'colour,' anfod 'ailment,' from bod 'being.' Here the notion of badness is beyond doubt, and in the first of the three, the English representative by the prefix mis confirms the theory. From the Cornish I take one example, for which I am indebted to Pott (E. F. i. 382), ananhel 'procella,' from anhel 'aura.'

In the Teutonic family, to take first the German, as the most familiar member of it, I find unart 'bad behaviour,' unbild (provincial) 'disgusting figure,' unbot (prov.) 'improper bidding,' undienst 'bad service,' unding 'monster,' unfall 'mischance,' unfing 'misdemeanor,' ungeld (prov.) 'a tax,' ungemach 'trouble,' ungethier 'monster, hobgoblin,' ungewitter 'thunderstorm,' ungezogen 'ill-bred,' unglück 'mischance,' ungott (obsol.) 'idol,' unkraut 'a weed' (Lat. mala herba), unmensch 'inhuman being, monster,'

unmuth 'bad spirits,' unrath 'dirt,' unsitte 'bad habit,' unthat 'misdeed,' unthier 'wild beast,' unweg 'bad road,' unwetter 'stormy weather,' unzeug 'nuisance.'

The German untiefe I must deal with apart from the rest, as I find the most opposite translations assigned to it. In dictionaries, among which I include those of Sanders, Adelung, and Campe, as well as Meissner, the only meaning is that of shallow water. and this in Sanders on the authority of passages quoted from Humboldt and Niebuhr. On the other hand, I am assured by two German friends, who are enabled to speak with the highest authority on such matters, that in society they only know the word as signifying very great depth of water. But Pott (E. F. i. 387) speaks of the twofold meaning of the word, and to myself this ambiguity is most acceptable, for the doctrine that the German un = male in power explains alike the negative and intensive meaning of the word. To the mariner shoal water is the gravest of dangers; and I may observe that it is in connexion with the sea that this notion is found to prevail, as for example in the passage from Niebuhr, to which reference has been made. On the other hand, with the landsman, or at any rate with the bad swimmer, it is deep water that is to be avoided. In the same page of his book, Pott quotes from Swiss dialects, the forms ungross (= sehr gross), Unkuh, Unmaul, as 'positive Steigerungen des Begriffes.'

In the Norse our prefix drops the nasal, and takes o in place of the German u. Here we find the following examples bearing testimony in favour of the power male:—

ó@ar 'annonae difficultates' (@ar 'annus).'
óbæn 'exsecratio' (bæn 'precatio).'
ód@ad 'nefas' (d@ad 'virtus;' or perhaps 'factum').
ód@amr 'foetor' (d@amr 'sapor').
ód@aun 'odor foedus' (d@aun 'odor').
óhapp 'infortunium' (happ 'bona sors v. fortuna inopinata')
ókynd 'monstrum' (kynd 'genus').
ókör (n. pl.) 'sors adversa' (kör 'sors').
óland 'terra infelix' (land 'terra continens').
ólestr 'mala fama' (lestr 'calumnia').
ólund 'indoles prava' (lund 'indoles').
ómadr 'nequam, nebulo' (madr 'homo').
órad 'imprudens consilium' (rad 'consilium').
ópefr 'foetor, odor ingratus' (pefr 'odor').

Lastly, Haldorson, from whose work the above are selected, has a general article: 'O, litera praefixa plurimis dictionibus, vim habet negandi et sensum invertendi, item interdum in malam partem trahendi,' where, as usual, the primary meaning is made to give place to that which is more common.

I turn next to the Dutch, not so much to find parallel examples in ondaad, ondier, onding, onkruid, corresponding to the German unthat, unthier, unding, unkraut, as to point to another variety of the prefix, viz. the form wan so often found in the Dutch vocabulary with a power the same as that we claim for the German un and Greek av. It will be convenient to give the meanings in German, as the power of the prefix will be then self-evident.

wandaad 'missethat, un- wandank 'undank.'
that.' wangebruick 'missbrauch.'

wangedrocht 'missgeburt.' wangelaat 'üble mine.' wangeloof 'missglaube.' wangeluid 'misslaut.' wangeschikt 'ungeschickt.' wangevoelen 'falsche meinung.' wangevolg 'irrschluss.' wangunnen 'missgönnen.' wangunst 'missgunst.' wanhebbelijk 'unreinlich.' wanhoop 'verzweiflung.' wanhout 'verdorbenes holz. wankleurig 'missfärbig.' wanlust 'verkehrte lust.' wanorde 'unordnung.'

wanraad 'schlechte wirthschaft, unrath.' wanschapen 'missgestaltig.' wanschepsel 'missgeschöpf.' wanshik'unschichlichkeit.' wansmaak 'übelgeschmack.' wanspraak 'falsche sprache.' wanstal 'missstand.' wansijdig 'ungleichseitig.' wantaal 'sprachfehler.' wantroostig 'untröstlich.' wantrouw 'misstrauen.' wanvrucht 'missgeburt.'

The Scandinavian branch, too, is familiar with a prefix van of the same power. The High German also employs wahn in much the same way. So also in Old English we have not merely unlust, untyme, unthank, untrust, unrest, unfaith; but also wanhope, wantrust, and wanton, i.e. wan-towen = un-gezogen.

But in spite of the oneness of meaning in the two prefixes un (on, &c.) and wan (van, &c.), the question of their identity involves matter for controversy. It is true that words beginning with u and o are precisely those in which the loss of a digamma is to be suspected, as in the Danish uld, ulv, under, urt, and ol, ord, orm, compared with our own wool, wolf, wonder, wort, and wall, word, worm. On the other hand, the prefix van (wan, wahn) has been referred with much

reason to the family of words which denote emptiness or defect, as the Norse adj. van-r 'empty;' and the Gothic van-s 'wanting,'—to say nothing of our own verb wane, and the sb. want. These again claim kin with the Latin uanus; but if so, the nasal is no longer radical, seeing that uac of uac-are, uac-iuus, or rather uoc of uocare, uoc-iuus, exhibits the root from which uanus is deduced, much as plenus from the obsolete ple-re (explere, &c.).

Leaving this point open, I would next draw attention to the prefix ue, uae or perhaps rather ueh, which presents itself in a small number of Latin adjectives. Here we have the very same difficulty which we had with the prefix an. In uepallidus the ue is said to have an intensive power, whereas it seems to represent a negative in uesanus, uegrandis, uehemens. I propose then the same solution, viz. that the word really meant male, so that uepallidus might well be equivalent to misere pallidus and uegrandis to male grandis; and I put this forward with the more confidence when I call to mind the Ovidian—

' uegrandia farra colonae Quae male creuerunt,' &c.

That grandis in the best writers is especially used of growth will be admitted; and indeed it is probably of the same stock with our word grow, so that quae male creuerunt seems to be an absolutely literal translation of uegrandis; and such probably was Ovid's meaning when he added these words.

That male is the more precise power of this prefix seems confirmed by the use of the so-called interjection uae in uae tibi 'ill betide you;' and then we

have the same word in the German substantive weh, and in our own woe. In the Latin uehemens we find the asperate preserved; and indeed in the passage just quoted from Ovid (Fast. iii. 445), many good MSS. give uehegrandia.

One of my colleagues at University College, when I communicated to him in words the substance of this paper, pointed out to me that the theory gave a satisfactory explanation of the name of the god Veiouis as 'the bad Jupiter.' Aulus Gellius (v. 12) includes this god among the laeua numina, as one in laedendo magis quam in iuuando potentem. In the same chapter he tells us that he had a temple at Rome between the Arx and the Capitolium, and further that the statue in that temple was armed with arrows, Sagittas tenet quae sunt uidelicet paratae ad nocendum. The old form of the name appears to have been Vediouis. Vediouei patrei, Mommsen's CIL 1. 807; but the MSS. of Ovid, in the Fasti iii. 430 and 447, have Veiouis. Still in either case Ve is the prefixed syllable, not Ved, for Iouis is connected with dies, and had at first an initial d. Hence also the d in the Greek oblique cases Διοs, &c.

It will be no violent assumption that this ue is but a curtailed variety of uan. A parallel case is to be seen in the root uan 'blow,' whence the Latin nouns uannus, uent-us, &c. In Sanskrit we find this root taking the two forms va 'blow,' and an 'blow;' and the Greek  $a\eta\mu\iota$  exhibits the root, first as Fa and then as a mere vowel a or  $\eta$ , thus again coinciding with the short form of a privative.

In the preceding investigation I have passed over the Latin language. Let me now briefly supply the omission. The Latin informis, which corresponds precisely to the Germ. ungestaltet, I claim to be an equivalent of male formata, and this on the direct authority of Priscian (1, iii. 10, Krehl): Informis dicitur mulier, non quae caret forma, sed quae male est formata; and this he says without any theory to bias him, for he is not dealing with etymology. Infamis again agrees with the notion 'having a bad character;' and intemperies corresponds with the German unwetter. Ignominia also implies an adj. ignomin-i-s corresponding to the adj. cognomin-i-s; and the prefix (in) of i-gnomin-i-s must have carried with it the notion of 'bad.' The word impotens is usually interpreted by scholars as an abbreviation of impotens sui 'unable to restrain oneself, ungovernable'—a theory somewhat too violent. But a scholiast on the phrase Aquilo impotens in Horace makes the adjective an equivalent of ualde potens. This view leads me to suggest that the full meaning of the word is brought out by the phrase male potens 'using power badly;' so that 'furious' is a tolerably satisfactory translation of the adjective.

But a still more decisive instance is seen in the adjective *inuidus*, which is very unduly considered to be a derivative from *inuideo*. The stream runs the other way, for it is contrary to the habit of the language to deduce adjectives in o- (*inuido*-) from compound verbs. Rather then let us treat *inuidus* as an equivalent to a theoretic maliuidus 'having the evil eye;' and from *inuidus* let us deduce *inuide-re*. This verb cannot have been formed from the ordinary preposition *in*, as it means far more than 'to look at.' I should have been prepared to regard it as a com-

pound with in = male, if the Latin language had so compounded verbs. We ourselves indeed have no difficulty in creating compounds, such as mistake, misspend, misunderstand; and the Gaelic, as seen above, gives us ain-lean 'to persecute,' from lean 'to follow,' and ana-caith 'misspend,' from caith 'spend.' Hence it is very possible that the Latin insequi 'to pursue as an enemy,' may have the in = male. The adjective insignis stands apart from the other adjectives commencing with in. We have here probably the ordinary preposition, so that the word corresponds to the Greek  $e\pi\iota\sigma\eta\mu os$ .

There is a question of form which has been passed over. It was probably noticed that some twenty of the Gaelic compounds had ana as the prefix rather than an. Here we have a parallelism with the Greek  $avae\lambda\pi\tau\sigma\sigma$ . I might also have quoted  $avae\delta v\sigma\sigma$ , but that the better form seems to be  $ave Fe\delta v\sigma\sigma$  (cf.  $eFe\delta v\sigma\sigma$  of the Odyssey).

I go back to the forms uan and amalus, to point out that these suggest a fuller uam-alus 'bad' of which uam alone belongs to the root, and this in English should take the form wav, the comparative of which should be wav-er,¹ which is all but one with our provincial waur 'worse.' It is here assumed that the suffix al of the positive has no right to enter into the formation of the comparatives and superlatives, and this is a point which has long been established (see Bopp's V. G. § 298 A). Thus in Sanskrit kship-ra 'quick,' leads to kshêp-îyas 'quicker,' kshep-ishtha 'quickest;' aισχ-ρο- to αισχ-ιον-, αισχ-ιστο-; μεγ-αλ-η to μειζον- (for μεγ-ιον-), μεγ-ιστο- ; mag-no- to maior (i.e.

<sup>1</sup> So Wavertree near Liverpool is called Wa'rtree.

mag-ior); litt-le to less-er (for lett-er, cf. Germ. besser, Eng. better), and least (for let-est, cf. best for bet-est, last for lat-est).

In order to strengthen the argument that malus is a corruption of amalus, let me point to the fact that mālus 'an apple tree,' seems also to have supplanted a fuller amālus, seeing that the Welsh write the word as afal, which is of course one with the German apfel, and our apple. In some parts of England (Mr. Morris, in the 'Ayenbite of Inwyt,' Introd. p. 4, says Wiltshire, Gloucestershire, and Somersetshire) the form opple prevails, and this opens a new vista. A German friend to whom I had communicated these ideas writes to me as follows: 'That before the a of (a) mālus "an apple tree," an original consonant, not unlikely a digamma, has been lost, I should venture to conclude, on the evidence of the Russian word jabloko and the Bohemian gablko. Grimm recognises in apf-el the same root as in ob-st, and indeed evidence might be given that the a in this word is by no means original. Even in the modern dialects we hear sometimes the plural öpfel, comp. Lith. obolys. Obst again, or as the original form is opaz, obez, seems to be the same as Ang.-Sax. ofät. May we compare the Greek οπ-ώρα i.e. the season when "obst" is ripe?'

In giving an affirmative answer to this query, I may notice that the Latin opes 'wealth, power,' may well have had for its primitive meaning the fruits of the earth, and that Ops, as the Goddess of Fertility, contains the same idea. Then again as  $m\bar{a}lum$  in this view stands for  $am\bar{a}lum$ , so pomum is probably a shortened form of op-omum. Lastly, this interchange of p and m seems also to explain the appearance of

the p in peior and pessimus by the side of malus. Possibly malus first exchanged its l for a d (cf. our bad), and then pedior pedsimus would easily have

passed into peior pessimus.

I ought perhaps to add that Pott (E. F. of 1859, i. 174) gives a very different origin both to the av privative and to the ue of uesanus. His words are: 'Insanus (in-, Gr. av-, Sskr. an- eig. das. Pron. ana, jener) und vêsanus (Sskr. vi-vom Zahlw. dvi ; jedoch nach Anderen aus vahis, aus).' From the same work (p. 386) I borrow also a passage of Simplicius, in which he speaks of the view which Chrysippus took of the prefix av. After showing that the use of the particle exhibits much confusion, he says: συμβαινεί ποτε μεν ταις αποφασεσι (negationibus), ποτε δε τοις εναντιοις συμφυρεσθαι; and soon after, και το κακον δε δηλουται πολλακις, ώς αφωνον ελεγομεν τραγωδον τον κακοφωνον. Thus we have a direct confirmation of the chief points contended for in the present paper.

P.S. A friend draws my attention to the following note of Davis on Cic. Tusc. ii. 8: 'Vecors Oenei partu edita] quae Ciceroni uecors, ea Sophocli Trach. 1061 est δολώπις. Apposite Festus: "uecors est turbati et mali cordis." Vide et eundem in uegrande. Non priuationem, sed malitiam seu prauitatem particula (ue) denotat, quemadmodum etiam in Veioue; licet eam uocem aliter interpretetur A. Gell. N. A. v. 12.'

#### VII.

THE LATIN et, que, atque (ac), AND THE GREEK  $\kappa a\iota$ ,  $\tau \epsilon$ , ALL OF ONE ORIGIN.

It has probably struck many philologers as somewhat strange, that the Latin language possesses three particles to express the idea of 'and.' Such a superabundance is at any rate an unusual phenomenon; but it has conferred on Latin writers an advantage of which they have not been slow to avail themselves. I refer to the power it gives of grouping the parts of a complicated sentence, so as to enable the mind to take in all the subordinate clauses without confusing them. This is a point to which I drew attention many years ago in a review of Mr. Henry E. Allen's valuable treatise entitled 'Doctrina copularum linguae Latinae,' in the 'Quarterly Journal of Education,' of the Useful Knowledge Society (vol. iv. p. 135). Thus in the passage (Cic. in Cat. iii. 8, 19),—'Caedes atque incendia, et legum interitum, et bellum civile ac domesticum, et totius urbis atque imperi occasumappropinguare dixerunt'—it will at once be perceived that et is employed to unite the longer clauses, while atque (ac), filling a more subordinate office, connects words within each clause. But if we translate both et and atque alike by our ordinary conjunction 'and,' the repetition at once offends the ear and confuses the mind. A better course is simply to leave the et untranslated and to supply the loss

by a pause. Thus:—

'Massacres and conflagrations, the annihilation of law, civil and domestic war, the downfall of the city and the empire—all these were approaching, they said.'

The insertion of the words 'all these' serves in fact

as a compensation for the several omissions of et.

We see a similar fitness in the use of the conjunctions in such a phrase as (Liv. xxvii. 18): 'Equites Numidas, leviumque armorum Baliares et Afros demisit,' where troops of the same class are united by et, those of different classes by que.

So far but two conjunctions are called upon to serve. In the following, all three are turned to account (Caes. B. G. vii. 79):—'Itaque productis copiis ante oppidum considunt; et proximam fossam cratibus integunt atque aggere explent, seque ad eruptionem atque omnis casus comparant.'

In this sentence we have first the taking a position, and secondly the active measures that ensued. These general ideas are connected by the particle et. But the active measures are again subdivided. On the one side we have a step towards action on the offensive in the dealings with the ditch; on the other, what is for the purpose of defence, in the precautions against a surprise of any kind. To mark this distinction que is employed. But these two ideas also admit of bifurcation. The obstruction of the ditch to an advance may be got over in two ways, by bridging it with hurdles, or by filling it up. So too of the threatened dangers, the most prominent, that of a sally, may well be selected for special notice. In

these subordinate divisions atque is available. Thus in Latin the particles et, que, and atque are employed to mark those distinctions, which in English we can often only denote for the eye by a variety of stops.

No doubt at times et alone is employed throughout a long period to connect all the single words and phrases and clauses; especially when the object is rather to deluge a hearer's mind with a torrent of ideas than to place them in due subordination before him, confusion for once being preferable to distinctness.

But if the Romans, having the three conjunctions at their disposal, made an intelligent use of their wealth, it still remains to account for the existence of that wealth. Now of the three particles, the one most open to suspicion is atque, and that on account of its greater length; for it is the habit of language to use for such an inferior office only short words. Some years ago I had placed before me an interpretation of a Lycian inscription, in which the interpreter had assumed that a certain repeated word of not less than four syllables meant 'and,' a suggestion against which my mind revolted. But even a disyllabic word has in it what is slightly suspicious; and this feeling is encouraged by the very form of the word, which may well be looked upon as made up of the ordinary preposition ad and que. Such at any rate was the view of Scaliger; and if this view be right, then the translation ought to be, not 'and,' but 'and what is more.' With this idea before me, I have been led of late, while reading any Latin author, to feel my way whether such a translation accords with the use of the word; and I am strongly inclined to answer the query in the affirmative, so far as a very large proportion of the examples is concerned, at the same time readily admitting that there are instances where the word seems to have been used with the power of a simple Of course the non-translation of the ad of et or que. atque will still leave an intelligible sentence in which but little is lost through the omission. Thus a reader is apt to be satisfied with the ordinary translation of atque as a mere 'and.' But my own conviction has been strengthened by what recently occurred to me. Having made known my feeling on this subject to an accomplished scholar, who happened at the moment to have the 'De Amicitia' in his hand, I found that he entertained a strong doubt on the subject, and, in support of this, pointed to two passages in the last chapter of that treatise; viz.: 'Nemo unquam animo aut spe maiora suscipiet, qui non sibi illius (Scipionis) memoriam atque imaginem proponendam putet;' and soon after: 'Nam quid ego de studiis dicam cognoscendi semper aliquid atque discendi?' In these cases he was disposed to regard memoriam and imaginem, cognoscendi and discendi, as practically synonyms. But I could not help feeling that in the first passage the more complete translation would tell us that the aspirant after glorious thoughts and deeds would think it a duty to place before himself the memory of the great Scipio, ay, and if possible, to have his bodily form in his mental view, for his statue or bust must have been familiar to the citizens of Rome. the second passage cognoscere, at any rate in the imperfect tenses, means strictly only 'to look thoroughly into,' 'to study with all care;' but after all such study may be profitless; discere, however, is 'to learn,' denoting successful study. It is true that the Latin

Nosce teipsum, and the Greek γνωθι σεαυτον are usually translated 'know thyself,' yet a more exact rendering would be, 'study thyself.' I hope then still to win over my friend to my opinion. At any rate, I have to thank him for drawing my attention to the use of προς δε in Homer and Herodotus, and of και προς in many Greek writers, where προς like ad of atque is used without a substantive, or, as the phrase is, 'absolutely,' so that we have a precise equivalent to atque as understood by me.

Let me notice, too, that in such constructions as Est id quidem magnum atque hau scio an maximum (Cic. Fam. ix. 15, 1) the atque fully supports the part I would assign to it, and to substitute et or que would be wholly inadmissible. Again, in Horace's Vocatus atque non uocatus audit, how incomparably more forcible is the atque than a mere et?

I am not sorry to find some confirmation of my view in what Wagner has written in his 'Quaestiones Vergilianae,' as first (q. xxxv. p. 563): 'Haec quoque exempla confirmant, id quod supra indicavi, ac gravius esse copula et; and again (567): Singularem huic particulae (atque) esse gravitatem, quum alia mihi indicare videntur, tum haec,' &c. where he goes on to quote a number of passages in proof, to which I can only refer.

In the case of the familiar phrase atque adeo, 'and what is more,' we have what may be used alike for and against the present theory. On the one hand, the use of atque rather than et is consistent with the power here claimed for atque; but it may be urged, that, as the second particle already contains the preposition ad, we have a tautology that has no justification. It may perhaps be enough to reply that in the Latin as in other languages such tautologies are of frequent occurrence. Thus phrases like ad Caesarem accedere, incurrere in columnas, with a repeated preposition, are met with everywhere; and, what is more to the point, tautology is one of the means employed in language to mark emphasis. Thus a verb of the first person ending in o has already in that final letter a compression of ego, and yet whenever the idea is to be made specially prominent, another uncompressed ego is attached: ego scribo in preference to scribo. In Spanish again, although tigo, migo are already full representatives of tecum, mecum, it is found more intelligible to say contigo, commigo; no doubt because the go had ceased to carry with it its proper meaning.

In the two formulæ atque utinam and ac ueluti there seems to be some reason for suspecting that the atque (ac) is but a deceitful imitation of our conjunction. To some extent this view receives support from two of the most distinguished scholars of Germany. Thus Lachmann, speaking of atque utinam in a line of Propertius (iii. 15, 51), says that in this construction 'delitescere copulativam ac particulae significationem.' So Haupt again tells us: 'In optandi formula atque utinam prior particula nonnunquam non connectit orationem, sed cum altera artissime cohaeret.' (See Haupt's 'Observationes Criticae,' of the year 1841, p. 38.) In the same pamphlet (pp. 46, 47), four passages are quoted where atque utinam occurs in a position which seems at variance with the usual habit and meaning of the conjunction atque. First from Caesar, in the verses where he addresses Terence :---

'Lenibus atque utinam scriptis adiuncta foret uis, Comica ut aequato uirtus polleret honore Cum Graecis, neque in hac despectus parte iaceres.'

## Then from Valerius Cato:

'Istius atque utinam facti mea culpa magistra Prima foret.'

Thirdly, from Valerius Flaceus (vi. 599):

'Eat atque utinam superetque labores.'

And lastly, a passage from Appuleius (lib. vii. p. 199, Elm.), where *atque* commences a sentence in such a manner that the idea of connexion, commonly belonging to the particle, seems out of place, viz.:—

'Atque utinam ipse asinus, inquit, quem nunquam profecto uidissem, uocem quiret humanam dare meaeque testimonium innocentiae perhibere posset.'

I have quoted the passages at length because the treatise of Haupt, like most of those occasional addresses which are published in Germany, is not very accessible to English scholars.

In the case of atque utinam, what appears to me to be a satisfactory explanation may be given. That utinam stands to quisnam in the same relation as uti to quis, will I think, be readily admitted; but in our own language the particle 'that' needs a preceding 'oh,' before the idea of a wish or prayer is fully expressed. Now, the interjection ah is well suited for introducing a wish, as in the Fasti (iv. 240): 'Ah pereant partes quae nocuere mihi.' But this interjection on the best authority should be written as a simple vowel a. Thus Wagner in his 'Orthographia Vergiliana' has: 'a interjectio ubique in Mediceo Romano aliisque optimis libris sine aspiratione scribitur.'... Idem volunt veteres gram-

matici.' In the second place, as ubi, unde, uter are now admitted to have had originally an initial c, as cubi, cunde, cuter, so for ut we may claim an older variety cut, making it in fact a mere neuter of the relative,—that is, an equivalent to quod; and so for utinam we are bound to insist on an older variety, cutinam. Now it is precisely where a combination with a previous vowel-ending word occurs that the guttural might be expected to maintain its ground. It is thus that in an inscription of the Augustan age, we find ne-cuter, which afterwards gave way to neuter. So again in si-cut and hu-cusque the c may well belong to the second element, for si 'so' is older than the compound si-c (for si-ce): witness the phrase si dis placet 'such is the pleasure of heaven.' Thus Mommsen in his interpretation of his Inscription 1447 unnecessarily assumes the loss of a c, where the recorded letters run sei si fecerit, which may well represent si sic fecerit of the later language. again, hō 'hither,' as seen in horsum (for hō-vorsum), is older than hoc or huc, which arose from a compound ho-ce. This theoretic ho would correspond to isto (= istuc), illo (= illuc), for the forms isto illo are of far more frequent occurrence than our editions of Latin writers would lead us to believe.

Putting then the two points together, that a is more correct than ah, and that cutinam must have been an older form of utinam, we have in a cutinam a good phrase for the expression of the idea 'oh that;' and, as the words are closely combined in pronunciation, they readily pass first into ac utinam, and then, under the ordinary doctrine that atque rather than ac should be preferred before a vowel, into atque

utinam, which in sound would still be identical with ac utinam.

As regards ac ueluti it is not easy to find so satisfactory a solution; but still as the adverb sem-el is admitted to have for its first syllable what denotes 'one,' as also sim-plici-, sim-plo-, sing-ulo-, &c., we can scarcely refuse to treat the second syllable of semel as that suffix of diminution which is so familiar in the Latin language, but is commonly converted into ul. Thus we have oc-ul-o- and ocello-, the latter standing for oc-el-el-o-. Similarly, semel, semol, and simul are now regarded as equivalents in form. Again, proc-ul may well be formed from proc as an older form of pro (see p. 77), by addition of the same suffix. Following these clues, I would suggest as a possible adverb from the same stock as the adjective aequo- a form aequel; and then the combined formula aequel uti 'just as,' would readily slip into ac ueluti. Be this as it may, I venture to deny that in the phrase ac ueluti we have any representative of the ordinary conjunction atque.

I next proceed to the main purpose of the paper, the identification of the particles et, que,  $\kappa a\iota$ , and  $\tau \epsilon$ . That  $\tau \epsilon$  is really one with que has, I believe, been long an admitted truth. The use and power of the two little words are in all respects identical; just as the pronouns  $\tau \iota s$  of Greek and quis of Latin are the same. But of the two forms we cannot hesitate to regard the guttural as the earlier occupant of the ground, for the passage of a guttural to a dental is of familiar occurrence. But if  $\tau \epsilon$  has supplanted an earlier  $\kappa \epsilon$ , we have in the two forms  $\kappa a\iota$  and  $\kappa \epsilon$  no great difference. Indeed in some alphabets the com-

bination ai is the only mode of designating an e. Still there remains, or seems to remain, a difference of quantity. I say 'seems,' because the Homeric hexameter abounds in examples of a lengthened  $\tau \epsilon$ , as (II. ii. 495),

## Αρκεσιλαος τε Προθοηνωρ τε Κλονιος τε.

It is true that the Homeric examples generally have two initial consonants or the suspicion of two initial consonants in the word which follows τε; for not a few words commencing with a liquid have lost a preceding consonant, and such derived forms as εσσενα, εσσυμενος, imply that σενω itself has undergone some such change. Thus we cannot altogether rely on such a case as

# Εγχει τ' αορι τε μεγαλοισι τε χερμαδιοισιν,

although Mr. Brandreth's form Fµeyaloioi seems unsatisfactory, if only because it is unpronounceable.

Nay, even the tenth line of Il. xi. affords no sure ground—

## Ενθα στασ' ηυσε θεα μεγα τε δεινον τε-

for several of the secondary forms of  $\delta\epsilon\iota\delta\omega$  (with which, of course,  $\delta\epsilon\iota\nu\sigma$ s is closely connected), as  $\epsilon\delta\delta\epsilon\iota\sigma a$ ,  $i\pi\sigma\delta\delta\epsilon\iota\sigma as$ , raise a suspicion that this family of words commenced with something more than a simple mute consonant. In confirmation of this view, one of my colleagues observes that the perfects  $\delta\epsilon\delta\sigma\iota\kappa a$  and  $\delta\epsilon\iota\delta\sigma\iota\kappa a$  cannot justify their possession of the diphthong  $\sigma\iota$  by such a form as  $\lambda\epsilon\lambda\sigma\iota\pi a$ , for this belongs to the class of so-called second perfects, the  $\pi$  forming part of the root, whereas the syllable  $\kappa a$  of  $\delta\epsilon\delta\sigma\iota\kappa a$ , as of  $\pi\epsilon\phi\iota\lambda\eta\kappa a$ , belongs to the tense-ending. Thus the best explanation in his view of  $\delta\epsilon\delta\sigma\iota\kappa a$  is on

the supposition that the o is part of the base of the verb, so that  $\delta o$  sounds as the dw of our dwell.

Further, it may be observed that the adjective  $\delta \epsilon \iota \nu o s$  has the power of giving length to other final vowels than that of  $\tau \epsilon$ , for example, in

Αιδοιος τε μοι εσσι φιλέ εκυρέ δεινος τε-

where  $\epsilon \kappa \nu \rho \epsilon$ , as the same scholar points out, must have supplanted a fuller form  $\sigma F \epsilon \kappa \nu \rho \epsilon$ , corresponding to the Sanskrit svasru, the Gothic svaihra, and the German Schwager and Schwieger. Thus the final of  $\phi \iota \lambda \epsilon$  becomes for the time long before the combination  $\sigma F$  of the following word.

In the Latin language, however, the examples of a lengthened que before a single initial consonant are more indisputable, for already Attius (Fest. p. 146) has

'Calones famulique metallique caculaeque.'

In Virgil indeed, as in Homer, the examples have for the most part two consonants, as

'Aestusquē pluuiasque et agentis frigora uentos.
Terrasquē tractusque maris caelumque profundum;'
or else a liquid, as

'Liminaque laurusque dei totusque moueri.'

But as the l of laurus is but a substitute for a d, as shown by its analogue the Greek  $\delta a \phi \nu \eta$ , we have no ground for suspecting the loss of a consonant before the l. Yet even Virgil has (xii. 363)

'Chloreaque Sybarimque Daretaque Thersilochumque.'

Ovid again, who is generally more strict in metrical matters than Virgil, was not afraid to write:

'Faunique Satyrique et monticolae Siluani' (Met. i. 193).

- 'Telasquē calathosque infectaque pensa reponunt' (iv. 10).
- 'Sideraque uentique nocent auidaeque uolucres' (v. 484).
- 'Othrysquē Pindusque et Pindo maior Olympus' (vii. 225).
- 'Liliaquē pictasque pilas et ab arbore lapsas' (x. 262).
- 'Peleusquē comitesque rogant; quibus ille profatur' (xi. 290).

While later writers, who were much more scrupulous in these respects than is commonly thought, have occasional instances of a similar liberty, as:—

- 'Taxique pinusque Altinatesque genestae' (Grat. 130).
- 'Electra Alcinoeque Celaenoque Meropeque' (German. 262).
- 'Laeuaquē dextraque acies astare uideres' (Corip. Laud. Just. iii. 177). <sup>1</sup>

On the whole then we must not reject the theory that  $\tau_{\epsilon}$  and que had once a long vowel, though of course the short vowel in the end thoroughly established its position, and this was to be expected when we consider the enclitic character of the words.

I have not stopped to discuss the favourite and convenient doctrine that the quantity of  $\tau \epsilon$  and que in such lines is to be ascribed to the influence of what is called cæsura or arsis, because I believe this doctrine to be merely a screen for the concealment of ignorance. I hold it to be a more just explanation that the two little words have lost a final consonant, a former possession of which would remove all the difficulties. For this theory I find a parallel in the case of uel 'or,' which as an enclitic takes the shorter form of ue, as uel mater, or else materue.

This *uel* is in origin probably an abbreviation of *uele*, i.e. an old imperative of the verb *uol*- 'wish,'

<sup>&</sup>lt;sup>1</sup> These three examples, together with that quoted from Attius, were suggested to me by Lucian Müller's elaborate work on Latin metres.

where the root vowel has passed from ŏ to ĕ, under the influence of the final e, in accordance with the law of 'umlaut.' Another example of such a modified vowel is to be seen in heus 'harkee,' an abridgment of an imperative heuse, from a theoretic verb haus-'hear,' a verb which would stand to the Latin sb. ausior auri- much as our own vb. hear to our sb. ear. Again, the assumed loss of an e in uele would be in accordance with the formation of the imperatives es, fer, dic, duc, and indeed ama, doce, audi also. from an obsolete verb gon-, or con- 'look' (the parent of the secondary gn-osc-, i.e. gon-osc- 'learn'), I assume an imperative gene, or cene (kene in sound), which first cut down to cen prepares us for two other varieties, viz. by decapitation, en 'look,' 'behold,' and, by loss of the final, ce, the familiar suffix of demonstratives, and demonstratives alone, as hic, istic, illic, sic, nunc. Here, too, let it be noted that it is only when doing duty as an enclitic that it discards the final n. con and cen themselves are perhaps truncated words, for οπτ-ομαι and οκκο- of the Greek, and oc-ulo- of the Latin point to a stem  $o\kappa$  (on) or  $o\kappa\kappa$ , whence ecce would be a good imperative; so that the verb con would be a truncated derivative for oc-on. It may be noted, too, that the original symbol for the vowel o was a picture of an eye, and the Hebrew name for the letter meant 'an eye.' This view accounts also for the ε of εκεινο-. Another instance of a word losing a final consonant when employed enclitically is seen in the family of words  $\kappa \epsilon \nu$ ,  $\kappa \epsilon$ , Dor.  $\kappa \bar{a}$ , and the more familiar av. Why the degraded form  $\kappa \epsilon$  should be selected as that under which Lexicons deal with these particles, it is difficult to say. The more legitimate course would be to start from KEV, for few will now defend the doctrine of a paragogic v. Still the error is a common one. Our English grammars, for example, still speak of an indefinite article a, which assumes. they say, an n before vowels; and in the same way Greek grammars persist in the folly of talking of a privativum, when the more genuine form is av. What however is important for our present purpose is admitted, that the form  $\kappa \epsilon$  is only used as an enclitic. But I may also call attention to the Doric kā as showing that here too a long vowel was once known, and secondly to the disappearance of the initial guttural in av, for this also is a matter which will throw light upon what is about to be said. It will be well however to note that, as the several forms of  $\kappa \epsilon \nu$ ,  $\kappa \epsilon$ ,  $\kappa \bar{a}$ , and av may be well deduced from a form kav, it is highly probable that our own language still possesses the verb from which all may have been deduced, I mean the verb can, which by its meaning is thoroughly fitted to supply the root of a 'potential' word; and further, the verb was known to the Latin language in the form que-o, for here also a final n once existed, as is proved by the archaic ne-quin-ont.

But the connexion between  $\kappa ai$  and que may next receive illustration. First of all the u in Latin words, which divides a preceding q from a vowel, must, as still in French, have been silent. This is shown by the shortness of the preceding vowel in such words as aliquis, neque, aqua, loquor.

It still remains to consider the passage of the diphthong ai first into  $\bar{e}$  and then into  $\bar{e}$ . Now a parallel case presents itself, as it seems to me, in a comparison of a certain class of Greek infinitives and the ordinary

Latin infinitive. In Greek, as in Welsh, we find a great variety of forms for the infinitive, as τυπτεν, τυπτεμεν, whence with the loss of the  $\mu$ , τυπτειν for τυπτεεν; also τυπτεναι and τυπτεμεναι, to take these as types, rather than as all representing actual forms. With the disyllabic suffix of τυπτ-εναι I compare the suffix of the Latin scrib-ere. That a Greek v should be represented in the first place by a Latin s, and then by a Latin r, is always to be expected. Thus the plural τυπτομεν 'we strike,' goes with a Doric τυπτομες and a Latin tundimus. Again the comparatival suffix 100 of the Greek has for its Latin analogue an archaic ios, melios, and a later ior, melior; and even the change in the quantity of the vowel of the Latin comparative follows the law, which gives us scriptores in Latin by the side of the Greek ρητορες. In the Latin infinitive esse, and the archaic passive dasi, for dari, we have the earlier sibilant retained. There remain then for comparison the final diphthong at of Tunteval and the final e of scribere. Now a final at in Greek soon lost much of its diphthongal power. Even Buttmann, a most zealous advocate of the prevalent accentual theory, lays it down, with others, that a final at or ot, though long for metrical purposes, must for the most part be considered as short in the rules of accentuation (Ausführl. Gr. Gr. Spr. § 11, 7). 'Thus,' says he, 'the plural nominatives τρίαιναι, &c., the passives in aι, as τύπτομαι, &c., and the infinitives ποιησαι, &c., are all accentuated in a manner that is inconsistent with the usual law for words with a long final;' and he adds the remark, 'It is therefore clear that in these very

<sup>&</sup>lt;sup>1</sup> We have already an example in the Greek  $\hat{\epsilon}a\phi\nu\eta$ , Latin lauru-.

common suffixes these diphthongs had been so far worn away that in the ordinary language they sounded to the ear as short, and that it was only in the sustained language of poetry that the long quantity was maintained.' So much for the Greek at. Much the same occurred in the final e of the Latin infinitive, for this also was once long in the old language. Some instances of this occur in Plautus, as:

- 'Átque argento cómparando fíngerē falláciam.' (Asin. ii. 1, 2.)
- 'Quid bráccium? Illut dícerē uoluí femur.' (Glor. i. 1, 27.)
- 'Nunquam édepol uidi prómerē. Verum hóc erat.' (Glor. iii. 2, 34.)
- 'Té salutem mé iusserunt dícerē. Saluáe sient.' (Glor. iv. 8, 6.)

## And also in Terence, as:

- 'Potin és mihi verum dícerē ? Nil fácilius.' (Andr. ii. 6, 6.)
- 'Auscúlta. Pergin créderē l' Quid ego óbsecro.' (Phorm. v. 9, 7.)

In the 'Rheinisches Museum' (xxii. 118) Dr. W. Wagner has added to this list, from Plautus:

- 'Egó scelestus núnc argentum prómerē possúm domo.' (Pseud. 355.)
- 'Nam cértumst sine dote háu darē. Quin tu í modo.' (Trin. 584.)
- 'Eum opórtet amnem quáerere comitém sibi,' (Poen. iii. 3, 15.)
- 'Non audes aliquod¹ mihi darē munusculum.' (Truc. ii. 4, 74.)

## And from Terence:

'Male dícerē, male fácta ne noscánt sua.' (Andr. Prol. 23.)

To say nothing of the cases where the e in question closes the first dimeter, as in Plautus:

- 'Abscéde ac sine me pérderē qui sémper me ira incéndit.' (As. 420.)
- 'Quid rélicuom? aibat rédderē quom extémplo redditúm esset.'
  (As. 442.) 2

<sup>&</sup>lt;sup>1</sup> Or 'aliquid . . munusculi.' <sup>2</sup> Add forē (Most. i. 3, 67.)

- 'Vix hóc uidemur créderē: magis quí credatis dícam.' (Poen. v. 4, 94.)
- 'At éccum e fano récipere uideó se Suncerástum.' (Poen. iv. 1, 5.)

These from septenarii, or comic metre. Instances from complete tetrameters are:

- 'Studeo hunc leonem pérderē qui méum erum misere macerat.' (Poen. 4, 1, 2.)
- 'Perii, animam nequeo uortere: nimis nsli tibicen siem.' (Merc. 125.)
- 'Qui súm pollicitus dúcerē ? qua audácia id facere áudeam.' (Ter. Andr. 613.)

The passage quoted from the Gloriosus (i. 1, 27), though it has the full sanction of the MSS., Ritschl already condemned in his Prolegomena (p. ccxxix.), and again in his text of the play. In the Rh. Mus. (vii. 312) he discusses the question at some length, arguing, on the authority of what he deems parallel cases, that the order of words, illut dicere uolui femur, is against the habit of Plautus. But in fact the cases he quotes are not parallel; and I venture to assert that when illut is used, as here, to draw attention to a coming word or words, in opposition to what precedes, it is a law of the language that the word or words so referred to should lie at a distance from the pronoun. as seen in the examples which I have quoted in my Grammar (§ 1106).

All this, then, tends to justify the doctrine that a Greek Kal may well have for its analogue in Latin both que and que.

But if kai, Te, and que be admitted to be one in origin, there still remains the Latin et. This some have thought to explain as only a metathesis of  $\tau\epsilon$ . Such a doctrine I of course put aside as untenable. My view is that as the Latin particles en 'behold,' and ce 'look,' are corrupted varieties of a fuller ken, so kai, te, and que have all lost a final consonant, while et has lost an initial, viz. a guttural, or k-sound. This theory, that et and que grew out of a fuller quet, is confirmed by the fact that que of the Latin quandoque uterque is pid in Oscan and pe or pei in Umbrian (Corssen's Aussprache, i. 337). But I am not wedded to a t as the original final. I think it not unlikely that the earlier letter was an n. Indeed a Greek particle could not have ended in a t. I am led to a preference of an n over a t by the form of our own and and the German und, for these virtually end with an n, a final d after an n being a common outgrowth in these two languages; and indeed in not a few combinations we ourselves practically drop the d, as for example in the phrase, 'four an twenty blackbirds,' &c.; and this not merely when a consonant follows, for we also habitually say, 'five an eight make thirteen,' dropping the d of and. I am the more tempted to identify the Latin et and English and, when I find the Greek έτερος taking in German the form ander; and it may also be observed that the syllable έτ of έτερος represents the έν of the numeral  $\dot{\epsilon}\iota s$ , thus furnishing an instructive example of the interchange of  $\nu$  and  $\tau$ . But if et belongs to the same stock with kai and que, it must have lost an initial guttural. Of the loss of an initial consonant numerous examples have already been noticed in this paper, and the loss of a final  $\nu$  in Greek is the great characteristic of forms in that language, a fact which has commonly been concealed under the theory of the ν εφελκυστικον or παραγωγικον. The Latin, too, shares the habit: thus while the Greek wrote indifferently

προσθεν or προσθε, κεν or κε, &c. the Latin has inde in place of  $\epsilon\nu\theta\epsilon\nu$ , though it is not unlikely that indus, or indis, rather than inden, prevailed in the older Latin, for we have here virtually a genitive with the power of 'from.' Exactly in the same way in our own island there co-existed forms henn-en, heth-en, henn-es, as well as our still current hence. Nay, over and above these Chaucer in the Knightes Tale (2,358) has the abbreviated hen—

'The fyrés which that on mine auter bren Shuln the declaré or that thou go hen.'

Thus we have a form scarcely distinguishable from the French en, which is the representative of the Latin inde, to say nothing of hin as it appears in hin-c.

But, to return to the little family of copulative particles, let me ask whether they may have grown out of the demonstrative family. The adverb *item*, signifying 'likewise,' has what is very near the meaning of our little word, but it is itself a compression of *itidem*, which stands to the adjective *idem* much as *ita* 'so' to *is* (ea, id). If this be admitted, a form ken, which as before stated I have long regarded as the primitive form of the family of third-person pronouns, is in its exterior well suited to have been the origin whence came the particles  $\kappa a\iota$ ,  $\tau \epsilon$ , et, and que, as well as  $\tau \epsilon$  and que, with long finals.

I was first led to the train of thoughts out of which this paper has grown by the consideration that  $\kappa a\iota$  and  $\tau \epsilon$ , on the one hand, could not well have been correlative particles unless they had been one in origin. But que and et also serve together; at any rate in short phrases. Thus, Livy has seque et cohortem (xxv. 14), et singulis universisque (iv. 2); and Sallust,

seque et oppidum (Jug. 26), seque et exercitum (ib. 55).

It was of course reasonable that the Greek language should use in correlation a repeated  $\tau\epsilon$ , and the Latin in like manner both a repeated et and a repeated que. Thus in exactly the same way the latter language has aut . . aut . . , vel . . vel . . , sive . . sive . . , simul . . simul.., qua..qua.., tum...tum..., nunc... nunc.., modo.. modo.. So in English we at times use or . . or . . , nor . . nor . . But here the more prevalent forms are neither .. nor .., either .. or .., in which the principle seems to be violated. The explanation however is not far to seek. Our either, so used, of course corresponds to the Germ. entweder, Old Germ. ein-weder (Grimm, D. G. iii. 38), where the ein is the mere numeral and weder a comparative of the relative. Hence it is virtually the same with the Latin alter-uter 'one of the two (no matter which)'; and this has for its positive ali-quis 'any one of any number.' In the same way neither seems to have grown out of a form ne-whether, corresponding to the old Latin ne-cuter, aft. neuter. Hence the just explanation of the combinations above quoted, is that originally a pause occurred after the words either and neither, as: 'either (of them), A. or B.,' 'neither (of them), A. nor B.' In the second of these cases the omission of the negative before A. has its parallel in the old construction, still admissible for poetry, which is seen in Shakespere, as (Antony and Cleopatra): 'For Antony, I have no ears to his request. The queen of audience nor desire shall fail; and again in Gray: 'Helm nor hauberk's twisted mail, nor e'en thy virtues, tyrant, shall avail.' Indeed we find the same in Greek

poetry also, as (Aesch. Agam. 532): Παρις γαρ ουτε συντέλης πολις Εξευχεται το δραμα του παθους πλεον. Nor is there any real difficulty or ambiguity in such The negative which precedes the second member makes its appearance in time to affect the following verb, and through this to influence the first of the two members. The same principle is at work in those Latin sentences where non modo was once said to stand for non modo non. Thus in such a sentence as: 'Assentatio non modo amico sed ne libero quidem dignast, the ne of ne libero quidem converts digna into indigna, and so acts upon the preceding amico. I may add that this explanation of neither and either is also applicable in such constructions as: 'both (of them), A. and B.,' 'whether (of them), A. or B.' A strong confirmation of this argument is seen in the occasional use of two interrogative particles after the Latin utrum, as in Ter. (Ad. iii. 3, 28), 'Utrum, studione id sibi habet an laudi putat fore, si,' &c. 'Which of the two is the just explanation—does he look upon it as an amusement, or does he think it will be a credit to him, if' &c.? Thus the particles which really correlate with each other are ne and an; and these may well be of the same origin, the two being connected by the disyllabic anne, which instead of being a compound I believe to be the original word whence both an and ne proceed. Thus, as already noticed,  $\epsilon \nu$  of Greek, and ni of Sanskrit, find themselves co-existing in the Greek evi; av of Greek, and the Sclavonic na in the Greek ava; to say nothing of the other cases quoted above.

<sup>&</sup>lt;sup>1</sup> See the following paper.

### VIII.

# ON THE LATIN PARTICLES aut, an, ně.

As I have been led to connect these little words with the adjectives alio- and altero-, Sanskrit anyaand antara-, I must commence by considering the origin of the latter; and in doing so my first duty is to put aside some derivations to which others have Thus Bopp (V. G. § 19, vol. i. lent their sanction. p. 33), and Pott (E. F. of 1859, pp. 301, 381, 393), are disposed to treat alius as a derivative of the Sanskrit ana, Latin ille; and the former connects ullus with ille and ultra. Dr. Donaldson in his Latin Grammar is so enamoured with the first of these two views, that he puts it forward three times, as p. 45, 'alius (like ille "that other," of which it is a by-form), &c.; p. 74, 'alius" another," is in constant use as a by-form of ille; p. 386, 'alius, which is merely another form of ille = ollus.' That ille and ultra are of one stock is past doubt; but ullus is of course the diminutive of unus, as uillum is of uinum. as bellus of bonus (cf. bene).

Again, the doctrine of the Indian grammarians that the Sanskrit antara- (altero-) is formed from anta 'end,' and a verb ra 'reach or attain,' may be accepted as an example of the way in which native Sanskritists,

satisfied with external similarity, deem it superfluous to consider the meaning of words; and the same onesided examination of etymological problems is not unknown among European Sanskritists.

That n of the Sanskrit anya-, antara- is more genuine than the l of alio-, altero- is rendered probable by the prevalence of the n in the Teutonic family, as Germ. and-er, Norse ann-ar; as also by the fact that the Latin language had a special love for the soft liquid, which often led it to substitute an l for other consonants. But besides alio- the Latin also possessed a short form ali- (whence alis, alid of Lucretius, and aliter). The ratio then of alio- to alisuggests for the Sanskrit an equal ratio, anya- to any-; and this theoretic any is for Englishmen an actual word. But our any is one with the German einiq, two words which are in fact diminutives of the numeral an Eng., ein German; just as ullo- 'any' is a diminutive of uno-. Hence, reserving for the moment all question as to the connexion of ideas, the an of the Sanskrit an-ya-, ant-ara- seems to be identical with our numeral an, and consequently with our one and the Latin uno-. But the q of einiq also claims attention, and this suggests the idea that alio- is only a variety of unico-, the guttural having disappeared. This explanation seems preferable to Bopp's explanation (§ 292) that the ya of anya- is the stem of the relative. for the two Latin forms ali- (alis) and alio- (alius) bear evidence that the y and a of anya- are two independent suffixes.

Some support to the doctrine that al of alius, &c. originally carried with it the notion of 'one,' is to be found in the identity as to meaning of the Greek

aλληλοι (evidently consisting of a repeated aλλο-) and the German ein-ander and our own one another.

In alio- and altero- it is commonly held that 'difference' is the primary meaning of the first element; but this in no way suits the compound forms aliqui-, aliquot, aliquanto-, aliquando; nor indeed all the uses of alio- and altero- themselves. The doubled alter and the doubled alius render it necessary to give to the adjective on its first occurrence the translation 'one' (pl. 'some'); and even the following clause makes no objection to the same translation, though the word 'other' is then admissible. Thus aliud est maledicere, aliud accusare, 'it is one thing to abuse, one to accuse.' So again alter exercitum perdidit, alter vendidit, 'one of the two lost, one sold an army.'

Although it seems at first a strange result that a word formed from one, itself so often employed to denote identity, should eventually attain to the sense of difference, cases nearly parallel may be adduced. Thus when Ovid, describing the half-military character of the farmer in his place of exile, says, 'Hac arat infelix, hac tenet arma manu,' the repeated pronoun evidently refers to different objects; and so we may, in place of the literal translation 'this,' substitute the words 'the one,' 'the other.' This repetition of hic has its counterpart in a similar repetition of ille, as (Ter. Ph. iii. 2, 16):

We may quote, too, as an illustration what Bopp says

<sup>&#</sup>x27;G. Quí istuc? Ph. Quia non réte accipitri ténditur, neque míluo, Quí male faciunt nóbis: illis quí nihil faciunt ténditur; Quía enim in illis frúctus est, in illis opera lúditur.'

in his V. G. (§ 371): 'That which in Sanskrit signifies "this" means also for the most part "that," the mind' (he should have said the finger) 'supplying the place whether near or remote.' Hence there is nothing very strange when we find in our oldest writers such a line as that which occurs in the Life of St. Edmund the King (Trans. Philolog. Soc. 1858), v. 9:

'Hubba was poper ihote: & poper het Hyngar.'

Just as the finger serves to distinguish 'this' and 'this' when they are to be referred to different objects, so no real confusion occurs when Davus in the Andria (ii. 2, 12) addresses first Pamphilus and then Charinus as a tu—

'Íd paves ne dúcas tu illam; tú autem ut ducas.'

Again in Ovid's Fasti (ii. 676) a consideration of this simple kind would have led to the correction in the easiest way of what in the received texts, even that of Merkel, is mere nonsense.

The passage is one in which the poet addresses the god Terminus; and, as both Merkel and Paley give it, runs—

'Et seu uomeribus, seu tu pulsabere rastris, Clamato, suus est hic ager, ille tuus,'

while others have, 'Meus est hic ager, ille suus.'

Now meus and suus are clearly wrong, because with meus Terminus would be claiming the land as his own; while suus would mean that the land belongs to itself, that is, if the phrase has any meaning at all, that the land is without an owner. Common sense requires 'tuus est hic ager, ille tuus,' the god addressing first one person, and then another. Strangely enough, 'tuus est hic ager' is the reading of nearly all

the MSS.; and thus the substitute of meus or suus in place of tuus is, on the score of authority and on the score of meaning alike, utterly indefensible.

In the compounds aliqui-aliquot &c. the notion of 'some' or 'any' prevails; but this is a meaning that constantly connects itself with words of numerical origin, as for instance in our own an-y, Germ. ein-ig, Lat. ullo-already quoted, and this with reason; for a diminutive of 'one' still leaves the idea of 'some.'

But our own term oth-er is itself only a comparatival form of one, standing for on-er. I was first led to this view by the recollection that our language, while it shares with the Greek and the Norse a strong love for the asperate th, also habitually interchanges this letter with an n. Thus the  $\theta$  of  $\mu \epsilon \gamma$ - $\epsilon \theta$ -os,  $\epsilon \iota \kappa$ - $a\theta$ - $\epsilon \iota \nu$ , corresponds to the  $\nu$  of  $\tau \epsilon \mu$ - $\epsilon \nu$ -os, mag-n-us, pig-n-us,  $\lambda \mu \mu \beta$ -av- $\epsilon \iota \nu$ , sper-n-ere; the  $\theta$  of  $\pi a\theta$ -os to the  $\nu$  of  $\pi \epsilon \nu$ - $o\mu a\iota$ ; and of course if  $\theta$  be convertible with  $\nu$ , a fortiori with  $\nu \theta$ : so that the forms  $\iota \delta \rho \nu \nu \theta \eta \nu$ ,  $a \mu \pi \nu \nu \nu \nu \theta \eta \nu$ , from  $\iota \delta \rho \nu \omega$ ,  $a \nu a \pi \nu \epsilon \omega$ , and  $\pi \epsilon \nu \theta$ -os,  $\beta \epsilon \nu \theta$ -os, by the side of  $\pi a \theta os$ ,  $\beta a \theta os$ , have nothing in them that is very strange.

In Anglo-Saxon again, the plural of the indicative present ends in  $a\mathfrak{d}$ , but that of the subjunctive present has on or an, and the past tenses also prefer on. Similarly a Norse nom.  $ann-ar \ (= alter)$  forms a fem. ac.  $a\mathfrak{d}ra$ , a dat. s.  $\ddot{o}\mathfrak{d}ru$ , a dat. pl.  $\ddot{o}\mathfrak{d}rum$ , &c.; and a nom.  $ma\mathfrak{d}\mathfrak{d}-r$  'man' stands by a gen. mann-s.

But it is not only in the Norse that our 'other' is represented by two forms, one with a liquid, annar,

<sup>&</sup>lt;sup>1</sup> L. and S. deny the connexion of these two words, holding that  $\pi \alpha \theta$ -oc belongs to  $\pi \alpha \sigma \chi \omega$ . But why may not all three be of one stock?

the other with an asperate,  $a \circ ra$  or  $\ddot{o} \circ ru$ , &c. In the provincial utterance of Lincolnshire the original n has been preserved. Thus a friend from that part of the country supplies me with the following phrases, which may be heard, he says, any day:—

'Was it A. or B. who told you?' Ans. 'I don't

know which, but it was toner.'

(Speaking of two pigs.) 'Toner a mun (I must) sell, but which on 'em a hardlins know.'

'It was toner (= either) Mrs. P. that I met, or toner (else) Mrs. O.'

Let me add, what it is not beneath the dignity of philology to record, that a youngster, F. S., aged two, seeing one day on the dinner-table a second pudding to his delight, exclaimed in my hearing, 'Oh, 'nunner pooin!' while his elder brother, H. S., at the same age had given a preference to another intelligible variety, 'nudder. It may further be noted that the theory which finds in the ali of aliqui-, &c. an equivalent of 'an' or 'one,' has its proof in the Norse form ein-hver, which Grimm himself (D. G. iii. 38) translates by the very word aliquis; and of course the Sw. en-hvar and Dan. en-hver, though now signifying 'quisque,' are the same word. The neuter form of the pronouns, ett-hvart, et-hvert, prepares us for the German et-was, which again = ali-quid.

This brings me almost to the Greek  $\epsilon\tau$ - $\epsilon\rho\sigma$ -, which however stands apart from all its congeners, as having an asperate. But this very peculiarity furnishes the strongest confirmation of the present theory, for among the various forms of the first numeral the Greek  $\epsilon\nu$  stands alone in this particular. I thus at any rate escape from the difficulty which Grimm meets by

simply cutting the knot, telling us that exepos had originally in all probability no asperate (iii. 636). That the asperate in these two words very possibly superseded a digamma I readily admit, seeing that the archaic Latin oeno-, the Lith. wiena-, and our own one virtually begin with this sound. It should also be noticed that both έτερο- and έν- agree in a common vowel, and that the interchange of a dental liquid and a dental tenuis is of the most ordinary occurrence. One result of this derivation is that epo- alone, not  $\tau\epsilon\rho\sigma$ , constitutes the comparatival suffix; but this is what I gladly accept. If my explanation of έτεροbe correct, the leading sense of the word is 'one of the two,' which in our Greek lexicons is given indeed, but is commonly relegated to the last place. To test this little matter I run my eye over our best lexicon, and find that in twenty-three adjectives compounded with έτερο- the word 'one' is essential to their translation:  $\dot{\epsilon}\tau\epsilon\rho$ -alkes, -ax $\theta\epsilon\sigma$ -, - $\dot{\eta}\mu\epsilon\rho\sigma$ -, - $\beta$ a $\rho\epsilon\sigma$ -, - $\gamma$ lauko-,  $-\gamma \nu a \theta o$ -,  $-\zeta \eta \lambda o$ -,  $-\theta a \lambda \epsilon \sigma$ -,  $-\theta \eta \kappa \tau o$ -,  $-\kappa \lambda \iota \nu \epsilon \sigma$ -,  $-\kappa \omega \phi o$ -,  $-\mu a \lambda \lambda o$ -, -μασχαλο-, -μερεσ-, -μολιο-, -πλοο-, -πορπο-, -ρροπο-, -σκιο-, -οστομο-, -ουατ- one-eared, -φαεσ-, -οφθαλμο- one-eyed; and I might add έτερο-ποδ- 'one-footed,' έτερο-σκελεσ-'one-legged,' for a person who has an imperfect leg or foot may well be so called. Of course in all these adjectives the notion expressed, viz. 'one,' is 'one of two.'

The Latin *iterum* seems to claim a place among the words which have been under discussion, and this claim is perhaps confirmed by the form of the German wieder. At any rate those who would derive *iterum* from the pronoun *i*- 'this' (Dr. Donaldson for one),

<sup>&</sup>lt;sup>1</sup> See the eleventh of these papers.

have overlooked the fact that the signification of the words repudiates the theory. A derivative from such a pronoun would signify 'hither, citerior.' The logical connexion of iterum with έτερον, Sansk. itara, is satisfactory, as well as that of form. Still a doubt hangs over the question when we find, devoid of all comparatival suffix, the Old Germ. ita 'again,' the Anglo-Sax. prefix ed- 'again,' the Welsh prefix ad-, and the ad- of like power in the Latin ad-mone- 're-mind,' a-gnosc- 're-cognise,' as well as the English a-cknowledge and archaic a-cknow, for here we come across representatives of the Greek ava. The Danish atter and Swedish åter are simply corruptions of an older achter, a variety of our after.

I conclude this part of the subject by collecting, chiefly from the D. G., the various forms that represent the Latin altero-:—Sanskrit antara- and itara-, Old Prus. antar-s, Lith. antra-s, Lett. ohtr-s, Old Slav. utoryi, Greek έτερο-, Latin altero-, Goth. anpar, Old Fris. other, Old Sax. other, ovar, odar, Ang.-Sax. over, Saterl. ar, or, Eng. other, Old Germ. andar, Mod. Germ. ander. Dutch ander. Norse annar. Swed. annan. Danish anden.

But the form *tother* must not be passed over. When it means 'the other' it is not difficult to account for the passage of th into a mere t, as such change is only in harmony with the law in Greek, which writes θριξ and τριχος, but not θριχος. This tother (also poper in Old English, as quoted above) is exactly one with the Greek θατερον for το άτερον. But for the most part the form tother (Scot. tither) has an article preceding it; and then the t is due to what Mr. Whitley Stokes calls Provection, having been transferred from the end of the preceding word, just as in for the nonce, in place of for then once. In other words, the tother would be more correctly divided thet other, precisely as the tone should give way to thet one. In fact, in the older writers tother is rarely found, I believe, except with a prefixed 'the.' In this form, for example, Jamieson gives one quotation from P. Plowman, two from R. Brunne, and four from Scotch authorities. I have noted fourteen occurrences of the phrases that oon, that other, one or both together, in the metrical parts of the Canterbury Tales. Thus in the Knightes Tale, v. 477:—

'Of whiche two Arcita higte that oon, And he that othur highte Palamon.'

And, again, the Life of St. Edmund the Confessor (Trans. Philolog. Soc. 1858) has in v. 477:—

'Nis pat on liper youn; : pe; heo ne lore pat oper also.'

In Greek too  $\tau o$   $\theta a \tau \epsilon \rho o \nu$  probably originated in  $\tau o \theta$   $\dot{a} \tau \epsilon \rho o \nu$ , the  $\theta$  before the asperated vowel representing the final dental of the original pronoun. I feel the more entitled to defend the division  $\tau o \theta$   $\dot{a} \tau \epsilon \rho o \nu$ , because Greek MSS., like Latin MSS. in similar cases, write such words as the article in immediate connexion with their nouns; the division, which is seen in our printed books, being due to editors alone.

I here assume that thet or that is an older form than the, and so discard the common doctrine that we have in the final t of that a neuter suffix. Indeed

 $<sup>^1</sup>$  So Bopp (§ 155): 'Aus dem Zeugniss der verwandten Sprachen erkennt man dass  $\tau \acute{o}$  ursprünglich  $\tau o \tau$  oder  $\tau o \delta$  gelautet habe.' (See also note 13 to § 349.)

such a theory is inconsistent with the fact that the pronoun that (like what) is capable of being used in connexion with words which are distinctly not neuters, e.g. that man, that woman. The original form I believe to be rather then, or than, the n having subsequently passed, as it so often does, into a t. Thus in then-ce, when-ce, &c., or, as they were once written, thenn-es, whenn-es, the es is a genitival suffix signifying 'from,' precisely as in  $\pi \circ \theta - \epsilon \nu$ , for so I divide the word, just as I wrote τοθ-άτερον above. The idea of any neuter suffix is, I think, to be rejected, among other reasons, because suffixes to imply negation are in themselves improbable; and again in ut-ero-, 'which of the two, ποτ-ερο-, the root-syllable has a claim to the dental. The  $\nu$  of  $aya\theta o\nu$  and m of bonum, as I have elsewhere explained, are no exceptions to the general law which rejects suffixes of mere negation.

With this preface I next proceed to the adverbial forms which signify 'or,' taking first those of the Teutonic family, as exhibited by Grimm (D. G. iii. 274, § c). But here I would suggest a caution against a prevalent error, that of attaching too much weight to antique as compared with later forms. A safer course is to give a preference to fuller forms over shorter, so long as one is sure that the greater length is not due to the addition of a new element. Thus while the Gothic aippau, Old Germ. edo, eddo, erdo, odo, &c., and Ang.—Sax. ove, Norse eva, and Latin aut exhibit no final r, we are justified in regarding, as so far purer forms, the Modern Germ. oder, and the Swed. and Dan. eller. The greater fulness alone is an argument in favour of

<sup>&</sup>lt;sup>1</sup> See my paper on Pronouns of the third person.

this view, but the question is at once decided by the necessity for a comparatival suffix in order to express the required idea. Similarly when we compare the varieties edo, eddo, erdo, we are bound to give a preference to the last; and of the Middle Germ. varieties ode, oder, alde, alder, while oder and alde have each their own superiority over ode, the highest claim belongs to alder, which differs but slightly from the Modern Germ. adjective ander. That aut is an abbreviation of alter (Fr. autre), seems to be commonly admitted; nor need we be surprised at the abbreviation, when we find such abundant evidence of the gradual absorption of the comparatival suffix in general in all the Teutonic branches (D. G. iii. 589-596), whenever the irregularity, so-called, of the formation prevents any resulting confusion with the positive. Grimm indeed seems to limit this truncation to the adverbial comparatives, but our old English writers extend it to adjectives. Thus Shakspere (Othello, iv. 3) talks of 'mo women,' mo men,' and Chaucer abounds in such phrases as (C. T. 9,293) 'Bet is quod he a pyke than a pikerell;' and we still use less in place of lesser.1 So the Latin, besides aut, exhibits an abbreviated comparative in the first part of ma-velle, ma'lle, which corresponds to our Ang-Sax. ma, and in sat for satis. The Keltic family takes the same liberty in its irregular comparatives, as for example the Breton in mad 'good,' gwelloch or rather gwell 'better;' drouk 'bad,' gwasoch

<sup>&</sup>lt;sup>1</sup> In the old language other instances are found, as *leng* in place of the fuller *lenger* (for *longer*); for example in St. Edmund the Confessor (published in the Society's volume for 1858), v. 366: 'per hit gan dasche adoun: hit nolde no leng abide;' and again, v. 510; 'He answerede him pe leng pe wors.

or rather gwas 'worse.' So too in Welsh the corresponding forms are gwell and gwaeth rather than gwellach and gwaethach, and in this language indeed there are some twelve other comparatives that have undergone the like curtailment.'

The etymology of the Gothic aippau, which Grimm places at the head of the series of words representing 'or,' had been the subject of a previous discussion in p. 60 of the same volume, but the writer with good reason seems to attach no great value to his own solution of the problem. The view taken in the present paper of course requires that the numeral 'one' shall constitute the first element, and accordingly it agrees closely with the Gothic form of this numeral, ain, making allowance for the passage from the dental nto the dental th, which we have already seen in this The final au of airpau corresponds no doubt to the final vowel of the old German eddo: and, as this appears to have lost an r belonging to the comparatival suffix, so the Gothic may be presumed, like ούτω for ούτως, to have lost an s, which in that dialect represents the German r; and  $\delta s$  is the very form which Grimm assigns to the comparative of Gothic adverbs (D. G. iii. 585, and with two examples 596 B. i.).

Our own particle or, as proved by its German equivalent oder, has suffered the same compression as gaf-fer for grandfather, as gam-mer for grandmother, as where (= quo) from whither, as where in Somersetshire for whether, as Scotch smure for smother, as the Danish far-broder (i.e. 'patruus,' or

<sup>&</sup>lt;sup>1</sup> See also Grimm, D. G.

father's brother). But better evidence cannot be found than that which the Old Frisian forms offer, where the ordinary adjective other, besides the fuller forms, has a gen. or-a, a dat. or-em, an acc. or-ne (Richthofen's Altfriesisches Wörterbuch, v. other), and again or-half, as well as other-half, corresponding to the German anderthalb ' $1\frac{1}{9}$ .' The word eith-er, so much used as the correlative of or, one is tempted at first to regard as a mere variety of other, especially as the first syllable eith coincides, as nearly as is to be desired, with the German ein 'one.' - But the German entweder, which in use corresponds to our particle either, is no doubt, as Grimm suggests, deduced from ein-weder, the n of which, in my view, has thrown out an excrescent t.<sup>1</sup> If so, we have what is nearly an equivalent of the Latin alter-uter, the sole difference being that, while the Latin attaches a suffix of comparison to both elements, the German with a wise frugality is satisfied with the presence of a single suffix of this nature. Care however should be taken not to confound the English either which corresponds to the Latin alteruter with that other either of our language which had the power of uterque, and in Anglo-Saxon was written aghvader (Grimm's D. G. iii. 55, § c.), or in shorter form ægder. From Modern English this latter form has disappeared; and the German jeder which represents it has given up its legitimate sense uterque for the more general quisque. An early example of our either = 'both' occurs in the Life of St. Kenelm, as published by the Philological Society (v. 355):-

<sup>&#</sup>x27;For rizt as heo pe vers radde: out berste aipere hire eze.'

<sup>&</sup>lt;sup>1</sup> See the Tenth of these Papers.

The forms an and ne remain. Already Grimm claims an as a word which belongs to the class of alter, influenced no doubt by the forms of the Germ. But if this be right, and ander and Norse annar. for one I have no doubt about it, the process probably was this: starting from a form anner, out of which alter grew, first the r was lost, in accordance with the law which governs irregular comparatives, which gave anne, a form actually in use in interrogative clauses to denote 'or;' and then this anne by the loss of its tail became an, and by decapitation ne, whereas the received doctrine has been that anne is compounded of an and ne. The only awkwardness in these results is that we are making aut, an, and ne the same word, whereas in use they must not be altogether confounded. Neither an nor ne can ever be allowed to act as substitutes for aut, nor the reverse. On the other hand, though an and ne may at times be interchanged, there are idioms in which this licence would not be admitted. This theory, by which an and ne are regarded as corruptions of a fuller anne, has its parallel in the theory (see above) which deduces both que and et from a fuller quet.

I feel that what I have here written will scarcely find acceptance with one class of philologers,—I mean those purists who expect roots and the derivatives from roots to take one and one only form, whereas in truth no language is so strictly homogeneous. Practically one finds every language surrounded by a cluster of what are called dialects, out of which the written language has borrowed no small number of elements. Thus our own language exhibits root-words sometimes in a triple variety, as bag, bay, and bow,—words in

origin all one, yet in use far from interchangeable, for it would require an interpreter if one came across such a statement as: 'He put a few clothes into his carpet bay, made a bag to his friends, and started for a voyage across the Bow of Biscay.' It is matter for less wonder then, if, starting from a twofold numeral, an (a) and one, we find a variety in the root-syllable of its derivatives, as any, other (or), else (A.S. ell-es), eleven, (el-leven), either; while the German has ein-ig, and-er, od-er, et-was, ei-lf; and the Old Norse goes so far as in the same noun to give us a nom. sing. ann-ar and a dat. pl. öth-r-um.

Still I find myself supported by the authority of Bopp as more than once expressed, as § 19, vol. i. p. 33: 'Die Spaltung einer Form in verschiedene mit grösserem oder geringerem Unterschied in der Bedeutung, ist in der Sprachgeschichte nichts Seltenes;' and again in § 516, vol. ii. p. 389: 'Hierbei hätte man zu berücksichtigen, dass in der Sprachgeschichte der Fall nicht selten vorkommt, dass eine und dieselbe Form sich im Laufe der Zeit in verschiedene zerspaltet, und dann die verschiedenen Formen vom Geist der Sprache zu verschiedenen Zwecken benutzt werden.'

#### IX.

ON PLURAL FORMS IN LATIN WITH A SINGULAR MEANING, AND ESPECIALLY ON VIRGIL'S USE OF menta.

ONE of the most serious hindrances to a right understanding of the Latin vocabulary is the doctrine, often propounded, that the poets by some strange licence might use a plural for a singular. But, whenever such an assertion is made, the only safe conclusion is, that the true meaning of the singular has been misunderstood. Castra occupies a prominent place among such words, but it is not an easy matter to decide what was that meaning of castrum which justifies the translation of castra as 'a camp.' Tradition supplies no evidence to guide us, and so we are driven to etymology. Now castrum in its final letters agrees closely with rastrum, rostrum, claustrum, plaustrum; and there can be no doubt that of these the first three are derivatives from the verbs rad-ere. rod-ere, claudere. Plaustrum as to form stands in the same relation to plaudere, but the connexion of meaning is somewhat obscure. Perhaps the explanation is this. We know that the old roads of Italy were narrow; and hence it was important that a large and heavy vehicle should so far as practicable give early evidence of its approach. Thus in the present day when a carriage of any kind enters a

long lane, too narrow for the passage of another vehicle in the opposite direction, it is found a useful practice on entering the lane to blow a horn; and thus it becomes a sort of law of the road, that the giving such a signal carries with it for the time a right to the sole use of the passage. Again, especially at night time, it is found expedient for a waggon to be provided with a set of bells. Now a clapper or two boards incessantly striking against each other is a cheaper way of effecting the same object; and plaustrum ought etymologically to signify 'a clapper.' It is true that even then the clapper is not the waggon. Still the sound of the clapper would be good evidence of the approach of the waggon, and thus there is no wide jump from the one idea to the other. vallum or palisade of a rampart, for example, is only part of the rampart, which includes the mound and the ditch; but, to an advancing army, the vallum from its superior height was the first object seen, and so at last came to signify the whole of the rampart.

If then we apply the preceding evidence to castrum we are brought to a syllable cad as the root; and here we come across what are too commonly regarded as independent words, cadere and caedere; but these are in fact as closely allied as our rise and raise, our lie and lay, or, what is nearer to the purpose, our fall and fell. In fact, fal, the root-syllable of these two English verbs, is the analogue of the Latin cad, for a Latin c has often supplanted a labial; and indeed the corresponding  $\pi \epsilon \tau$  of  $\pi \iota \pi \tau \omega$  has preserved the original consonant; but a classical p under Rask's law should be represented in our language by an f. Other examples of a Greek  $\pi$ , a Latin k (q), and an English f

corresponding to one another, are seen in πισυρες, quattuor (Go. fiduor), Eng. four, and doubly so in πεμπτος, quin(c)tus, with the proper name Quinctius, fifth. Again, a d in Latin, Greek, and even English, is often interchangeable with an l. Thus to take what in form is precisely parallel, the familiar noun calamitas was written, we are told, by Pompey, as kadamitas. I have said that this word thus quoted in illustration is identical in form. I may go further, for it is also of the same stock, as calamitas speaks of a something supposed to issue from the stars, a blight falling upon a crop.

Nay, the change from cad to fal is also to be traced in Greek and Latin in this very root, for σφαλλειν and fallere mean strictly 'to cause to fall, to trip up:' hence the frequency of the combination fallere pedes. And again, in our own language, although the orthodox course is to make fall an intransitive verb, in country life 'to fall a tree' is at least as common as 'to fell a tree.'

My belief then is that in military language, and among the Romans military language was familiar to everyone, castra meant generally 'trenching tools,' the ordinary axe, and besides these the pickaxe, spade, &c. This view is confirmed by the fact that the verb castrare 'to cut,' has not merely the notion of emasculare, like our own verb as applied to horses, but is applicable in the general sense of the verb cutting, and so is used in connexion with such accusatives as arundineta, uites, arbusta, caudas catulorum.

One advantage that results from this theory is that the phrases mouere castra and ponere castra receive an intelligible explanation, whereas with the transla-

tion castra 'a camp,' we are reduced to an absurdity, for even the trees of an abattis, after serving the purposes of one camp, are never carried on to the next station to perform the same duty. The tools, however, form an important part of a soldier's plant, so to say; and when an army arrived at the close of a day's march, they would be the first things to be taken from the impedimenta. Yet after all there is a gap in the theory; for although trenching tools are essential to the making of a camp, and although the phrases mouere castra and ponere castra already obtain in this way thoroughly satisfactory translations, yet there is a wide difference between the tools employed and the resulting camp. This gap I propose to bridge over by the suggestion that the castrorum metator, in laying out the proposed form of a camp, marked the outline by having the tools themselves deposited as he went along where they would presently be needed. On the completion of this duty, the figure would be duly represented to the eye by the series of tools.

But the use of a plural form to denote a singular idea is so inconvenient, that when the use of the word in the singular with its original meaning has passed away, there is an irresistible tendency to call the singular again into service with the new meaning hitherto limited to the plural. Hence castrum 'a fort,' at last established itself, and still more the diminutival castellum 'a little fort.' It should be noted, however, that in the connexions castrum Inui (Verg. Æn. vi. 766), castrum Mineruae (Apulorum) of the Itineraries, and castrum Mineruae (Brutiorum) of Varro (ap. Probum ad Verg. Ecl. 6), the word is of

a totally different origin and meaning. We have now a noun belonging to the same family with the so-called adjective but rather participle castus 'pure,' and the sb. castu- 'purifying.' These evidently point to a verb, and the verb really exists in cārĕre (lanam) 'to card wool, that is, 'purify' it, for Varro is no doubt right when he explains the term (L. L. vii. 92, p. 339, Spengel's ed.) by purgare, and connects it with cărēre. In Greek the root is represented in the adjectives  $\kappa a\theta$ αρο- and κεν-ο-. In this view castrum is 'a place of purification,' 'a shrine,' and so identical in power with delubrum from lau-ere. Again this second castrum has also its derived verb castrare 'to purify,' whence castrare uina saccis 'to strain' wine, of Pliny, and perhaps castrare libellos of Martial (i. 36). In the latter passage there may possibly be a double entendre.

Nay, that plaustrum itself did not in origin mean 'a waggon' is shown by its use as a plural in not a few passages, where evidently a single waggon was before the writer's mind, as: Modo longa coruscat Sarraco ueniente abies atque altera pinum plaustra uehunt (Juv. iii. 256); Ipse uides onerata ferox ut ducat Iazyx per medias Histri plaustra bubulcus aquas (Ov. Pont. iv. 7, 9); Tardus in occasum sequitur sua plaustra Bootes (Germ. Arat. 139). In other passages the notion of a single waggon seems, if not decided, yet preferable, as in: Tardaque Eleusiniae matris uoluentia plaustra (Virg. Georg. i. 163); Dicitur et plaustris uexisse poemata Thespis qui canerent agerentque (Hor. Ep. ii. 3, 275); Ruris opes paruae, pecus et stridentia plaustra (Ov. Tris. iii. 10, 59). Thus plaustra itself belongs to the class of words here under consideration. Yet already in Plautus, Cato, and Cicero the singular *plaustrum* was in use with the meaning of a single waggon.

meaning of a single waggon.

Another word in which the true meaning of the singular is commonly missed is furca. This word is in fact a compression of a trisyllabic for-ic-a, the first syllable of which is seen in the verb for-a-re, and virtually in fod-ere, for the r and d are interchangeable in these words, just as in auri-sb. 'the ear,' and audi- vb. 'hear.' Our own language also shares the interchange, for the root, in obedience to Rask's law, appears with a b in bore and bod- of bodkin, whether we use this noun with Shakspere in the sense of 'a dagger,' or in reference to the little instrument which belongs to a lady's workbox. Then as regards the meaning of *furca*, there can be little doubt that we should translate it 'a prong,' seeing that *bi-furco-* and *tri-furco-* mean 'two-pronged' and 'three-pronged.' It was at first then only as a plural that it could be employed to denote 'a fork.' Some of our dictionaries indeed venture to give as the original meaning of furca 'a two-pronged fork,' quoting in proof Virgil's furcasque bicornes, which however rather points the other way; for if the noun already denoted a two-pronged instrument, the epithet bicornes would be superfluous. However, the phrases Furcae and Furculae Caudinae for the fork in the road near Caudium were established at a time when it was still necessary to use a plural to denote 'a fork.' So Plautus (Persa, ad fin.) has, 'et post dabis (manus) sub furcis, where later writers would have said sub furca. It is true that in the Casina (ii. 6, 37) we find, 'ut quidem tu hodie canem et furcam feras;

but here we may well suspect that the poet wrote furcas, and that the singular was an adaptation to later usage introduced in after-time. Such changes may be proved to have taken place in the text of both Plautus and Terence, just as has happened to the plays of Shakspere.

The nouns forceps, forpex, and forfex have suffered much in the hands of our modern lexicographers, who have followed the guidance of the author of the book entitled 'Varronianus.' The writer of that work thought he saw in the first part of these words the adverb foris, and he was disposed to deduce the final syllable from the several verbs cap-io, pect-o, and fac-io. But in truth the three forms are only dialectic varieties of the same word. From forc- of furc-a it was thought desirable to form a derivative by the addition of the diminutival suffix ec. I say diminutival, because Pott has clearly shown that the suffix ar of Greek substantives adds the notion of little; while the identity of the Greek ar and Lat. ec is proved by the forms murex, sorex, pellex, podex, corresponding to μυαξ, ύραξ, παλλαξ, πυνδαξ. But the power of the suffix is also sufficiently determined by the three words cimex, pulex, culex. Now in the case of furca, the addition of a suffix ec would have led to an unpleasing form, forc-ec-, and hence, to soften the sound, a labial was substituted for one of the offensive gutturals; and so arose the three varieties, forc-ep-, forp-ec-, forf-ec-. But as forcep-, standing for forcec-, could only mean 'a small prong,' it required a plural to denote the more complex instrument consisting of two claws. Thus forcipes, as 'a pair of pinchers' for the extraction of teeth, is used by Lucilius: uncis

forcipibus dentes euellere (ap. Charis. i. 74); but the later writer Celsus in the same sense habitually uses the singular. The word is also used as a plural for the 'blacksmith's pinchers' in Cato; but here again both Virgil (Geo. iv. 175, and Æn. xii. 404) and Ovid (Met. xii. 277) have tenaci forcipe ferrum or ferrum forcipe curua. It was from the consideration of this special use of the pinchers that some etymologists would derive the word from the adj. formus 'hot' and cap-ere. But the connexion with furca is confirmed by the fact that while Pliny (ix. 31, 51) ascribes to the crab brachia denticulatis forcipibus (al. forficibus), Apuleius (Apol. p. 297, 4) speaks of the furcae cancrorum.

The plural *uolsellae* is used of a pair of tweezers by Varro in the proverbial phrase, 'pugnant uolsellis non gladio:' and also by Martial; but for Celsus the singular has supplanted the plural, so that the word follows the example of *forceps*, and is used in the same sense.

Again the familiar noun rastro- (m. or n.) I may safely assume to have meant originally 'a single tooth of a rake,' or 'a scraper with but a single point or edge.' Hence Terence, Virgil, and Ovid agree in the need of a plural to express the more complicated rake with many teeth. Still, as these were permanently combined in one instrument, it was found in the end convenient to use the word in the singular, and as such it occurs in the later writers, Pliny and Seneca.

Another example is bigae, which is of course a contraction of biiugae, and so being an adjective requires a noun equae to complete the meaning, 'two mares yoked together for the purpose of drawing a chariot;' and in this form it is employed by Varro, Catullus,

and Virgil; but again the unity of the combination becoming fixed, eventually later writers, Tacitus Pliny Suetonius and Statius, exhibit biga as a singular. Precisely the same fate attended the use of quadrigae, 'four mares yoked together for drawing a carriage,' for the word is a plural in Cicero and Virgil, but is exchanged for a singular quadriga in Propertius Pliny Martial and Ulpian. If it be here objected, that Virgil and Propertius being contemporary might have been expected to use both of them either the singular or the plural, a legitimate answer seems to be found in the consideration, that the higher style of Virgil's poetry would justify, if not require, the use of the older form.

An eighth example is cassi-, the plural of which denotes 'a net,' in Virgil (speaking of a spider's web) and Ovid generally; but the singular with the same meaning is found in Ovid (A. A. iii. 554) and Seneca. Hence it seems reasonable to suppose that the singular word originally meant 'a single mesh of a net.' At the same time it must be admitted that many little nets are at times united to form one large net.

Ninthly, folles as a plural, like our own equivalent in form and meaning bellows, is the only shape known to Cicero Virgil and Horace, and this agrees with the fact that the instrument consists of two flaps; but Livy (xxxviii. 7) Persius and Juvenal have in the same sense the mere singular.

As *litera* originally meant but a single character of the alphabet, a plural was necessary to denote 'words or writings;' yet Ovid and Martial have the word in the singular with the sense of a letter or epistle.

It was once the fashion in school books to say that

limina was used poetically for the singular, meaning 'a threshold.' This error however has long been thrust aside, as it is known that a door has two limina, the l. superius or 'lintel,' the l. inferius or 'threshold,' the word signifying what carpenters call 'a tie,' and being derived, not indeed from liga-re, which would have given ligamen, but from a lost lig-ĕre which has also produced a noun lictor (not ligator). Still in not a few instances the singular is used to denote a gate or entrance.

Currus is another word as to which our lexicons are unsatisfactory. It is clear that in not a few passages the plural of this noun is used in speaking of a single carriage, as in Virgil (Æn. x. 574), 'Effundunt-que ducem rapiuntque ad litora currus;' and Ovid (Met. ii. 6), of the chariot of the sun: 'Vasti quoque rector Olympi non regat hos currus.' Again the same poet (Trist. iii. 8, 1) has: 'Nunc ego Triptolemi cuperem conscendere currus.' So in Lucan (vii. 570): 'Mauors agitans si uerbere saeuo Palladia stimulet turbatos aegide currus.' Further, that currus did not in itself mean a carriage, is shown by Virgil's use of the word in speaking of the plough (Georg. i. 174): 'Stiuaque, quae currus a tergo torqueat imos.' Now the phrase regere currus has a special fitness, if currus means strictly 'a wheel,' for it is the wheel which a driver has to look to. Further, it is probable that mere rollers came into use before carriages. Moreover, the word roll is but a variety of whirl and hurl; and the last word in Scotch is a synonym for wheel in the term hurl-barrow (Jamieson). Nay in Scotch hurler by itself means 'one who drives a wheelbarrow;' and the simple verb hurl is applicable alike to the driving a

wheelbarrow and to a ride in a carriage (Ib. supplement). For the latter use I quote from the same; 'If a frien' hire a chaise and give me a hurl, am I to pay the hire? I never heard of sic extortion.' Even when hurl has the sense of the Latin torquere (hastam), we have the notion of the circular movement which with the sling and Roman jaculum preceded the casting forward; but cur of curro is the equivalent of the hur or hir of our hurry, hurl, and the Dorsetshire hir-n (A. S. yrn-an). Hence I do not hesitate to claim for the Latin curro the original notion of revolving rather than that of running. Such will well suit the repeated phrase in Catullus (64, 327, &c.): 'Currite ducentes subtegmina, currite fusi;' and Virgil's similar use of the verb (Ecl. iv. 46): 'Talia saecla suis dixerunt Currite fusis . . . Parcae.' So also in those passages which speak of the potter's wheel, as Horace's (Ep. ii. 3, 22): 'Currente rota cur urceus exit?' No doubt the mere notion of running or quick forward movement is far more common; but it is most unphilosophical to decide the question of priority by mere number. Nay, it is generally to be suspected that the older the meaning of a word the fewer should be the examples. From all this I conclude that mere circular movement was first denoted by the root, and secondly that the onward circular movement as of a rolling stone was the idea which preceded that of simple running; so that we have here a mimetic word, an imitation of the sound heard in rapid whirling.

The word septentriones at the outset could only have been used as a plural; and such was still the form in favour with Cicero and Cæsar; but Virgil

Ovid Pliny and Vitruvius have the singular; and this variety was only the more requisite, when names were required alike for the Ursa major and Ursa minor, where Vitruvius employs the terms major and minor septentrio. It seems indeed a somewhat violent proceeding for Virgil to have retained the singular form, when by tmesis, as it is called, he gives an independent position to the numeral in Talis Hyperboreo septem subiecta trioni Gens (G. iii. 381). As to the etymology of the word, two different accounts are recorded by Festus. That which would deduce it 'a septem bobus iunctis quos triones a terra rustici appellant,' has little internal evidence to support it. I cannot but give a preference to his second statement, 'Quidam a septem stellis,' for tara is the Sanskrit for a star, and indeed is still preserved in several of the vernacular languages of India. For the Latin I would assume a form ter-iones with that masculine diminutival suffix ion, which is well known in matell-ion-, senec-ion-. An e rather than an a is supported by the familiar stella, i.e. ster-ula, or rather ster-el-a.

I have thus dealt with castra, plaustra, furcae, forcipes, forpices, forfices, uolsellae, bigae, quadrigae, casses, folles, literae, limina, currus, septentriones; and these examples are sufficient to establish the principle that, when an object consists of two or more like parts, a word, in itself denoting one of these parts, is first employed as a plural to denote the compound, but eventually is supplanted by the singular, which then also denotes the compound.

With this premised, I call attention to the use of a plural menta in the Æneid: Nosco crines incanaque

menta Regis Romani primam qui legibus urbem fundabit, &c. (Æn. vi. 810). Now the ordinary meaning of mentum, 'a chin,' will not avail here, for we need not stop at the English phrase 'a double chin.' My own conviction is that the first meaning of mentum is 'a jaw,' and thus the plural menta would denote 'both the jaws,' that is 'the mouth,' or rather in the present passage those parts on which the beard grows, both above and below the opening expressed by the word mouth.

How readily words of the same stock are employed to denote 'the jaw,' whether upper or lower, the mouth made up of both jaws, the chin, the beard, the cheeks, the gums, is well seen in those which begin with the syllable yev or gen. Thus in Greek we have (1) yevusb. f. to which our lexicons assign the meaning of 'under-jaw,' and in the pl. 'both jaws, the mouth with the teeth; (2) yevelov 'strictly the upper jaw, but usually the part covered by the beard, the chin, and later the jaw, the cheek; (3)  $\gamma \epsilon \nu \epsilon \iota a \delta$ - sb. f. 'a beard,' and in pl. the 'cheeks;' (4)  $\gamma \nu a \theta o$ - (=  $\gamma a \nu - a \theta o$ -) sb. f. 'the jaw, mouth;' but strictly the 'lower jaw;' (5)  $\gamma \nu a \theta \mu o$ - sb. m. 'the jaw;' (6) Lat. gena- 'cheek;' (7) dens genuinus 'a cheek-tooth or double tooth;' (8) gingiua 'the gums;' (9) Welsh gên 'mouth, jaw, and chin;' (10) Fr. gan-ache 'lower jaw.' Next, with the changes of consonant to be expected, (11) Sanskrit hanu, 'the jaw;' (12) Gothic kinnu, 'chin;' (13) Old Germ. kinni; (14) Eng. chin; (15) Lith. zanda-s 'jaw;' and then, with a labial in place of the n, (16) Germ. gaumen and Eng. gums, together with (17) Sanskr. jamba 'the chin;' (18) γαμφηλαι 'jaws of lion,' &c. 'beak of bird.'

But, as has long been pointed out, especially by Buttmann in his Lexilogus when treating of μελας and κελαινος, a guttural often slips into a labial, probably by a passage first into gu or gw, then into w, and then into m. We must therefore connect with the preceding family of words (19) the Latin mentum, (20) the French menton of the like meaning, and also (21) Germ. mund, (22) English mouth, (23) the Gr. μνστακ- sb. m. 'upper lip or moustache,' as also (24) μαστακ-, sb. f. 'mouth, beak, upper lip.' And this with the more confidence when we find (25) a Welsh mant 'a mandible,' whence is-fant 'lower jaw,' and gor-fant 'upper jaw.'

But it behoves the philologer never to be satisfied until he come to a verb as that from which the other parts of speech are deduced. Now the one among the many meanings attached to yevus, mentum, &c. which most readily connects itself with action is 'the jaw,' as the instrument of mastication; and the Latin verbs mand-ere and mand-uca-re at once present themselves with the desired meaning and a suitable form, for as the Latin scāla stands to the verb scand-ere, precisely so mala to mand-ere. Indeed the combination nd and l are frequently convertible, and the Latin seems generally to have a predilection for the liquid l. Thus the verb  $m\ddot{o}l$ -ere 'to grind,' has long been held to be of the same stock with mand-ere. Many too of the allied languages exhibit the form with an l, as Greek μυλη and Latin mola 'mill,' with pl. μυλαι as 'the grinders,' or to use the Latin phrase the dentes molares. So we have Lith. verbs, mal-u, mal-in-u and mald-in-u, Russ. melju, Irish meil-im, Goth. mal-an, Germ. mahlen. (See Bopp's Glossarium Sanscritum, v. mrid.)

But Buttmann in his Lexilogus (§ 48, on ovai, p. 198) justly observes that stamping or pounding was a process older than grinding, and so he finds the earlier sense in the Latin sb. mall-eo- m., and the Latin verb mulca-re. To these we must add the Sanskrit mridā or mardā 'dust,' the Gothic malma 'sand,' and mulda 'dust,' as also our own mould, whether applied to earth well broken up or to brown sugar, and the German malm-en, zermalm-en 'to crush.'

The Greek verb  $\mu a \lambda - a \sigma \sigma - \omega$  too is said to have signified originally to beat and so make soft, as in dressing leather, or, we might add, in making a beef-steak tender.

The same scholar treats the Greek verb  $a\lambda\epsilon$ -ω and the nouns  $o\nu\lambda a\iota$  and  $a\lambda\epsilon\nu\rho\sigma\nu$  as of the same stock. And if this be just, we must add to the family the nouns  $o\nu\lambda a$  n. pl. 'gums,' and  $\delta\lambda\mu\sigma$ - m. 'a mortar, kneading-trough, the hollow of a double tooth,' &c. The doctrine that crushing preceded grinding is confirmed by what we see in the familiar verb mord-e-'bite,' of the Latin compared with the Sansk. mrid or mard, which is translated 'conter-ere.' Hence too we see that the Latin mort-ario- n. has been justly claimed as belonging to the family. Further, the Prakrit has mal in the place of the Sanskrit mard.

Hence mordere and molere are of the same stock; while as to form, we have a precise parallel to the connexion between ardere and alere, for the notion of elevation is the original idea in both these words, as also in the adjective arduus (see p. 173); and if ardere happens to be limited to the action of flame, so also alere flammam is a familiar combination. But I am

here reminded of a doctrine which I put forward some thirteen years ago as to the etymology of the verb obsolesco. To the arguments I then adduced I have now to add other evidence, and as the matter is of some importance I will put together all that I have to say upon the subject.

Those who would connect the verb with abolere and exolescere fail to explain the appearance of the s, for obs in place of ob can only be defended when the simple verb begins with a thin consonant, p, c, or t, a principle which extends to the two other prepositions which end in b, ab and sub. Accordingly, I at one time was tempted to connect the root of obsolesco with the sol of solium, 'a seat,' consulere (old form consol- or cosol-) 'to sit together (in deliberation),' so that obsolesco should contain in itself the same metaphor as our verb 'supersede.' But I have now no doubt that the idea of dirt belongs to obsolesco, and that it is of the same stock with sordes. I am led to this conclusion, first, by the habitual union of the two words, as 'Ut eum, cuius opera ipse multos annos esset in sordibus, paulo tamen obsoletius uestitum uideret' (Cic. Verr. ii. 1, 58); 'Splendetque (uirtus), per sese semper neque alienis umquam sordibus obsolescit' (Cic. Sest. 60); 'In homine turpissimo obsolefiebant dignitatis insignia' (Cic. Phil. ii. 105); then in Hor. (Epod. xvii. 46), 'O nec paternis obsoleta sordibus; and (Od. ii. 10, 5), 'Obsoleti sordibus tecti;' and in Val. M. (iii. 5, 1), 'Candida toga turpitudinis maculis obsoleta

In two of the passages just given, the notion of defilement is supported by the appearance of the adjective *turpis*, or the abstract noun derived from it;

and these had no doubt for their physical and original sense that of dirt, whence the idea of moral pollution readily flows. But the word obsoletus did not need the aid of sordibus for the expression of this idea, for we find uestis obsoleta in Liv. xxvii. 34; uestitus obsoletior in Cic. in Rull. ii. 5; obsoletus Thessalonicam uenisti in Cic. in Pis. 36; and uestitus obsoletus in Pseudo-Nep. Ages. 8. Again, the word is opposed to enituit in the younger Pliny (Pan. iv.); and in one of the tragedies which bear the name of Seneca (Agam. 976), there occurs the marked phrase sanguine obsoletus.

But the matter seems placed beyond all doubt when we come across a verb *obsordesco*, uniting in itself the same two distinct though connected meanings which belong to *obsolesco*, 'to pass out of use,' and 'to become dirty on the surface;' and this on the authority both of an old and of a late writer, so as to prove the great length of life which *obsordesco* enjoyed, viz. 'Obsórduit iam haec in me aerumna míseria' (Caecil. ap. Non. vii. 603, who himself translates the word by *obsolescere*), and 'Ne coma fusa umeris fumo obsordescat amaro' (Prud. Apoth. 214).

Of course the common result of non-use is the collection of dust, rust, mildew, mould, and all those undesirable objects, which the Romans included under their term *situs*, a word which etymologically ought only to mean 'putting down and leaving alone,' as it of course comes from the verb *sinere*.

Several of our modern languages exhibit the same root with the same meaning, as with ourselves in *soil* the verb, *soil* the sb., especially in the form *night-soil*, also in *sullage*, s(o)lush, sully; but in the last we have a word of French origin, representing *souiller*, by the

side of which exists the adj. sale. Perhaps after all we come back to the obsolete verb sol-ĕre (to sit down), whence consolere, for the natural place for sitting in the earliest states of society is the ground, solum; and this also is the leading source of what we call dirt. Even the notion of solēre 'to be wont,' results from that of permanence, which resides in the posture of sitting, as opposed to locomotion. Hence indeed suesco and consuetudo are probably akin to sol in the sense of 'sit' (cf. the Germ. sitte); and we have a parallel in the Latin mos moris, which is of the same stock with mora 'delay,' and so with the Greek  $\mu o \nu \eta$  and the verbs  $\mu \iota \cdot \mu(\epsilon) \nu \cdot \omega$  and maneo, as also with our own manner and Fr. manoir, &c.

But to return to the word mentum, I find a little difficulty in three words, which by meaning and partly by form seem to claim connexion with the family of mol or mal 'crush, grind,' &c. viz.:  $\mu a \sigma a - o \mu a \iota$  'chew,'  $\mu a \sigma \sigma - \omega$  'knead' (with its derivatives  $\mu a \xi \omega$ ,  $\mu a \gamma \mu a \mu a$ ), and maxilla 'the jaw.' Thus while mala serves beyond all dispute to connect mand-ere on the one side with maxilla on the other; maxilla and  $\mu a \sigma \sigma - \omega$  imply a form  $\mu a \gamma$  rather than  $\mu a \lambda$ . Yet  $\lambda$  and  $\gamma$  seem to be sounds utterly inconvertible, unless indeed we may say that the y sound forms an intermediate link between them. Such was my contention in a late paper read before the Philological Society, which compared  $\theta \nu \gamma a \tau - \epsilon \rho$ - and filia-; and the argument derives strength from the parallelism seen in the Greek  $\mu o \gamma \nu s$  and  $\mu o \lambda \nu s$ .

At any rate, the Latin nouns, which having a long vowel before an l, form diminutives in xillo (or sillo), seem to owe the long vowel of the simple noun and the x of the diminutive to an original guttural in

the syllable which precedes the *l*. Thus āla for ahala, paulo- for pauculo-, tālo- beside aστραγαλο-, pālo- beside pango, and tēla beside tex-ere, seem all to claim a lost guttural, which would account for the forms axilla, pauxillum, taxillus, paxillus. The loss of the guttural would be exactly parallel to what we see in our own words, nail, hail, rail, sail, wain (waggon), rain, beside the German nagel, hagel, regel, segel, wagen, regen; and indeed the Latin vēlum, whence uexillum, may have grown out of an older suegelum, and so be one with the German segel. See also the remarks on the Greek noun παρασειον 'upper sail,' in the paper on the German prefix ver.

## X.

## EXCRESCENT CONSONANTS.

Although generally averse to the introduction of new grammatical terms, I have thought it desirable to ask admission for one on the present occasion, because the ordinary term 'epenthesis' seems to have been formed upon a false theory, and so to have misled, as it appears to me, not a few philologers; and among these several who hold a place in the front rank, I especially refer to the three German scholars, Grimm Bopp and Diez. Thus the words 'einschiebung,' 'eingeschoben,' 'einschaltung,' are with them in constant requisition; and in my mind this assumption of an 'inshoving' always raises a presumption that some error lies concealed beneath them. For example, in speaking of certain diminutives (iii. 668), Grimm has to deal with a syllable in, which, not seen in the nominative, appears in the oblique cases, and so he is led to regard the n as intrusive, viz. in prentili 'a small brand,' g. prentilin-es, d. prentilin-e, &c.; where however it seems more reasonable to suppose that the nom. has lost an n, as is admittedly the case with the Latin ordo ordin-is, ratio ration-is, caro carn-is. The same doctrine is repeated by him twice in p. 672 and again in p. 678.

In my paper entitled 'Quaeritur' (see below), I refer to Bopp's dealings with the Sanskrit genitives

plural, asva-n-am, tri-n-am, sini-n-am, the n of which he regards as euphonic, while it appears to me to be the genitival suffix, as in our own Frier-n Barnet, contrasted with Abbot's Langley and King's Langley, as also in Buck-en-ham (Norfolk), and, what is substantially the same, the county town Buck-ing-ham, which originally was nothing more than 'Mr. Buck's home or house,' for the largest town had its beginning, and this often in the residence of a single family. Again in Weinhold's Alemannische Gr. (Berlin, 1863), I find (§§ 409, 411) that the nouns fater, Karl, Heinrich had two forms of the genitive, fateres fateren, Karles Karlen, Heinriches Heinrichen, &c. Besides, if the n of  $\operatorname{asva-n-am}$  &c. be not a genitival suffix, there is nothing whatever to represent the idea of genitivity (excuse the word), since am, like the corresponding  $\omega \nu$ of Greek nouns, is a mere symbol of plurality.

Diez too (Gr. ii. 201) assigns to the old French perfect of dire a form déimes (= diximus) or 'mit eingeschobenem s, déismes.' But in my paper on the Latin perfect (Philolog. Trans. 1860-1, p. 185), I was led to a very different view, viz. that deismes is the more genuine form, seeing that the Latin diximus itself grew out of a fuller dix-ismus, corresponding to dix-istis.

Again it was probably an impression that a consonant was required to prevent hiatus which led the French to sanction the division aime-t-il, as though the t were a foreign element; but of course we have here what represents the Latin amat ille. In il est the t is silent; but in the inverted form est-il? coming before a vowel, it is pronounced; and the same applies to aimet-il, as it should have been written.

Those who would insert consonants 'hiatus vitandi caussa,' never stop to explain to us why one consonant rather than another is selected for this ignoble office. But in truth it may be doubted whether any real instance can be found, unless we are to accept such as 'Maria Ranne' or 'the Law ran the Prophets' of London speech. At any rate in a large majority of the instances usually adduced it will be found that the so-called epenthetic consonant is no foreign matter, but either an original part of the word, or else a simple outgrowth from the consonant immediately preceding.

In a paper by Mr. Weymouth (Philolog. Trans. . 1856, p. 21), and in Bindseil's valuable, even though unfinished work, 'Abhandlungen zur Allgem. verg. Sprachlehre' (Hamburg, 1838), the true theory, as it seems to me, is given as regards the difference in the position of the organs of speech for the production on the one hand of the nasals m, n, ng, and on the other of the mutes b, d, q. As those writers point out, it depends solely on the position of the velum palati whether the one set of sounds or the other is heard. When the *velum* is so placed as to leave a free passage for the air through the nose, we have the nasal; but the moment this passage is closed, the sound passes at once to the allied mute; so that what began as an m may end as b, what began as ng may end as g (goose, bag), what began as n may end as d. Such secondary consonants then must be regarded as natural outgrowths, or, to use my new term, as excrescent, rather than intrusive, as intrinsic, not extrinsic.

But it is not with the nasals alone that there is this tendency to pass from one consonant to another. Whenever the organs of speech which are employed in the production of two consonants lie near one another, a passage from one to the other is apt to occur. But it is especially from the dental series that excrescent consonants proceed; and this was perhaps to be expected, as this class of consonants occupy a middle place, and so have an affinity for the labials on the one side, and gutturals on the other. Precisely as, when we throw great force into the sound of an n at the close of a syllable,—for instance, to take a vulgar example, but not the less valuable on that account, in pronouncing the words gown or drown-ed,—there is a strong tendency to produce what would be written as gownd or drownd-ed; so if we lay a stress upon an s there naturally results a following t, and hence a Roman intending to say pos found that he unintentionally uttered post.

I propose then to take into successive consideration all the following combinations, in which for convenience the alphabetical order is preferred: ct, ft, ht (cht), lt, nt, pt, rt, st; bd, gd, ld, nd, rd;  $\lambda\theta$ ,  $\nu\theta$ ,  $\rho\theta$ ,  $\sigma\theta$ ,  $\phi\theta$ ,  $\chi\theta$ ; cs, gs, ns; lz, rz; pf; mb, mp, ng, rn. In treating these combinations I must be brief; but throughout my view is that the second of the two consonants is excrescent.

1. Ct: plecto, cf. πλεκ-ω, plico, simplex; nect-o, cf. necesse, necessarius, &c., aναγκη; flect-o; pect-o; γαλα for γαλακ, but gen. γαλακτ-os, with Lat. lac, also lacte as a nom., g. lact-is; cf. Ang.-Sax. meol-oc and our milk; ικτ-εροs, with iec-ur and ήπ-ap; κτειν-ω, with καιν-ω, εκανον, κεκονα; κταομαι κεκτημαι beside παομαι πεπâμαι, for the consonants κ and π are here interchanged as in κοτεροs, ποτεροs, &c.; νυκτ-os, noct-is compared with νυχα, νυχιοs (see p. 69).

The Latin nouns in etum had an older form in ectum, as shown clearly in the case of uirectum, dumectum, aft. uiretum, dumetum. In these, however, um alone, in my belief, is the suffix, so that carect-um, frutect-um, salict-um, &c. come from car-ec-, frut-ec-, salic-(n. carex, frutex, salix), throwing out at the same time an excrescent t.

Indeed generally this passage from a c to ct is apt to be followed by the loss of the guttural, so that the c seems itself to have been transformed to a t; but whenever the preceding vowel is found to be long, it would probably be safer to assume the existence of an intermediate form with ct. Thus diutius by the side of diu leads me to suspect that the base of the latter word was diuc-; and, indeed, I have elsewhere (Tr. Philolog. Soc. 1856, p. 320) given my reasons for believing that all nouns of the fourth declension once ended in uc, so that genuc-ulum is a regular diminutive from genu(c-), and the adj. metuc-ulosus duly formed from metu(c-). Hence I hold diutius to stand in place of diuct-ius, which exhibits an excrescent t.

Otium again, for this form (not ocium) has the exclusive support of inscriptions, I am strongly inclined to regard as a shortened form of an obsolete oct-ium, and this again as a decapitated variety of uoct-ium, from the root of the verb uŏc-are 'to be empty,' and the adj. uoc-iuo- 'empty,'—two words which, following the best authorities (Bergk, Zeitschrift f. Alterthums-W. 1848; Mommsen, Corp. Inscr. i. p. 70, b. ad fin. &c.), I am bound to write with an o, not an a. As regards meaning, such an etymology has all in its favour; and I cannot but prefer it to Prof. Aufrecht's suggestion (put forward, however, with much hesi-

tation), that it may come from auere 'to be happy,' an idea substantially the same as Corssen's (Kritische Beiträge, p. 17), who would connect it with the Sanskrit root av of various meanings, 'iuuare, tueri, ualere, gaudere,' &c. out of which he seems to give a preference to 'tueri,' so that his autium would be directly opposed to bellum, peace to war.

The long e of sētius by the side of sĕcus and sĕquius also receives its due explanation, if it be considered as standing for sectius with an excrescent t. Much has been written on the origin of these words, as by Corssen (Beiträge, p. 5), Fleckeisen (Rhein. Mus. viii. 227), Schweizer (Kuhn's Zeitschrift, viii. 303). My own view is that we must start from a theoretic adj. sequis 'second' from the verb sequi. This word I find entering into the formation of sesquis 'one and a half,' Germ. anderthalb, which we cannot but treat as a compression of semi-sequis, when we place it by the side of sestertius, i.e. semis-tertius 'two and a half,' Germ. drittehalb. But the words alter and Seutepos, the ordinary words signifying 'second,' are in form comparatives. Hence a neuter comparative sequius has nothing in it to offend; and secus itself I also hold to be a variety of the same word, having lost its i, precisely as minor and minus have (see p. 122). On the other hand, the meaning of 'other or otherwise' accords well with the uses of the words in question, as in the common phrase haud secus, and such passages as :--

<sup>&#</sup>x27;Hácc nihilo 'sse míhi uidéntur sétius quam sómnia' (Plaut. Men. v. 7, 57);

<sup>&#</sup>x27;Quid séquiust aut quid interest dare te in manus . . . ?' (Trin. 130);

where I readily accept the simple emendation of sequiust for secutus est of the MSS. A very different but I think not very satisfactory etymology of setius is given by Corssen (Beiträge, p. 11).

As to the derivation of nitor nixus, which Corssen

deals with in the same work (p. 20), but I think not very happily, all is smooth, if, following the guidance of the old Latin grammarians themselves, we start from the sb. genu- 'a knee,' or rather from its older form genuc- as heard in the Greek yout, the Latin genuc-ulum, afterwards genic-ulum, corresponding to our own knuck-le, Germ. knock-el-n, to say nothing of the Germ. knicks 'a courtesy.' Thus the original meaning of niti is 'to kneel,' and its secondary sense of 'straining' or 'striving' arises from the idea of employing the knee as a fulcrum in many muscular actions, as for instance in cording a trunk. The old form gnitor, given by the grammarians, and the participle nixus, together assure us that nitor has lost two gutturals, and must have been corrupted from a fuller gnictor, where we have almost the same form as in genic-ulum, and what strictly corresponds to the Germ. knick-s, excepting indeed as to the t, which I claim as an ordinary outgrowth. Forcellini for once seems to have gone wrong, and to have missed the original meaning of the verb *niti*, so that it may be worth while to give evidence on the subject, which frotunately is easy to find. Thus Festus has, 'Nixi di appellantur tria signa in Capitolio ante cellam Mineruae genibus nixa.' So we have in Plautus (Rud. iii. 3, 33), 'Ambae te obsecramus genibus nixae;' in Virgil (xii. 303), 'Impressoque genu nitens terrae;' in Livy (xxvi. 9), 'Matronae nixae genibus orantesque;'

in Ovid (Her. xxi. 100), 'Et de qua pariens arbore nixa deast;' in Seneca (Thyest. 60), 'Quem genu nixae tremuere gentes;' Germ. (Arat. 67), 'Dextro namque genu nixus diuersaque tendens Bracchia.' And if this be not enough we have the fact that the constellation called by the Greeks Evyovaow has for its Roman name indifferently Ingeniculus and a simple Nixus. Thus Cicero (Arat. 373) has, 'Flexo confidens corpore Nixus,' and again (N. D. ii. 42), 'Engonasin uocitant genibus quia nixa feratur;' while Ovid (Met. viii. 182) writes, 'Qui medius nixique genu est anguemque tenentis;' and Manilius (v. 645), 'Nixa genu species et Graio nomine dicta Engonasi ingenicla inuenis sub imagine constans.'

In closing this long section on the combination ct, I deem it but right to add that Corssen asserts that an original c never disappears before a t, while he admits that when a c has superseded an earlier g, as in autor autumnus from augeo, it is not so protected; but a doctrine in itself so arbitrary has found little support with other scholars.

2. Ft: see paper on post and after (p. 121). To the examples there given add tuft by Fr. touffe, Scotch tuff; -schaft, the suffix of German nouns, freund-schaft, fiend-schaft, contrasted with our friend-ship, &c.; laught-er from laugh.

3. Ht (cht, ght): Ang.-Sax. liht, Germ. licht, our light, compared with Lat. luc-; so miht, macht, might with the Ang.-Sax. verb mag-an; niht, nacht, night (see noct- above); Germ. specht by the side of Lat. pico- and our wood-pecker; acht-en and veracht-en, the analogues of οπτ-εσθαι ὑπερ-οπτ-εσθαι; fechten, fight, compared with pug of the Latin pugnus

pugna pugil and  $\pi v \xi$ ; gelächt-er by the side of lach-en lache; and the whole classes of German adjectives in ig and icht, as beinig and beinicht.

4. Lt: βελτ-ιον- βελτ-ιστο-, compared with bello-, mel-ior, and our well; alt-ero by the side of alio-ali-qui-; and ult-ra, ult-ro, ult-erior, ult-imo-, as contrasted with sup-ra, por-ro, sup-erior, min-imo-; but forms connected with comparatives and superlatives will be discussed more fully in the following paper. Add salt with Lat. sal; Germ. falte compared with pal of the Latin palma, palam, pl-ic-a, &c.

5. Nt : as βεντ-ιστο- by bono- and bene; λεοντ-os by leon-is; S. ant-ara 'one of two' by Norse ann-ar, our one, Sc. ane, and the so-called article an; Lat. int-ra, int-ro, int-erior, int-imo-, int-er, int-us, from in; cont-ra, cont-ro, from con, but see following paper; Germ. ent-zwei, ent-gegen, where ent stands for the prep. ėin or rather en = Lat. in; ent-weder 'either,' formerly ein-weder, where ent stands for the numeral ein 'one;' ent the prefix, Lith. ant, the analogue of the Greek ava; the Germ. eigent-lich, nament-lich, bescheident-lich, &c.; Fr. loint-ain, from loin, ef. prochain, from proche; Lat. tegument-um, cognomentum, &c. from tegumen, cognomen, &c. The t also of imperfect particles I hold to be an outgrowth from the preceding n, so that in the crude form scribent-iscriben is an old substantive like the Lat. unguen (whence unguent-um), and still more like the German so-called infinitive schreiben, while the final i is probably a remnant of the preposition, or rather in this case the postposition, in. We ourselves, by the way, once wrote i for in, as in the Shaksperian phrase, 'By the second hour i' the morn' (Antony and Cleopatra, iv.

- 7, 4). In this way the Latin participle will be brought into agreement with the Keltic forms, as the Welsh yn myned 'iens,' more literally 'in itione,' and with our old phrase a-going for an going, of precisely the same power. To these I add from Mr. Weymouth's paper tyrant by  $\tau \nu \rho$ -avvo-, and ancient; the latter in both its senses, as an adj. = Fr. ancien, and as a sb. = our ensign.
- 6. Pt: πτολεμο-, πτολι-, πτυελο-, πτερνα-, compared with πολεμο-, πολι-, πυελο-, περνα-, and Lat. pernα-; πτυ-ω compared with Lat. spu-o, Eng. spit; τυπτ-ω, ρίπτ-ω, θαπτ-ω, ὑπτ-ιος, Lat. subt-us, subt-er; but as to these see next paper.
- 7. Rt: heart by Lat. cor, and  $\kappa\epsilon\alpha\rho$ ; uespert-inofrom uesper-; fert-ili- from fer-; mort-i- from mor'die,' as well as sort-i-, part-i-, art-i- (but see next
  paper); Germ. juchert or juchart, representing Lat.
  iuger-. In such words as braggart, I have long been
  inclined to think that the t is excrescent, and that the
  syllable ar is a diminutival suffix, one with the er
  of fresh-er 'a little frog,' and of hamm-er, dagg-er,
  fing-er, and the Germ. mess-er. The Latin in the
  same way was in the habit of forming contemptuous
  terms for men, by means of a diminutival suffix, as
  toc-ulion-, and the Greek too, as  $\pi\lambda o\nu\tau$ -a\kappa-,  $\phi\epsilon\nu$ -a\kappa-,  $\lambda a\lambda$ -a\gamma-. If such explanation be just, it must apply
  also to such words as slugg-ard, cow-ard, &c.
- 8. St: crast-ino- from cras; prist-ino- from pris, i.e. prius; rust-ico- from rus; Ligust-ico- from Ligus; Libyst-ico-, Libyst-ino-, and Libyst-id, from Libys; οστ-εον by the side of os ossis; ost-ium from os oris. Here let me add that the Greek στοματ- is but a decapitated οστ-ομ-ατ-, and so of the same stock with the

Latin os oris. In ov-ou-at- the Greek has preserved the root-vowel o, which is lost in the Latin nomen and Germ. namen. Again an excrescent t is seen in the Latin post, as also in post-ero-, post-umo-, in extero-, ext-erior-, ext-umo-, ext-ra-, magist-ero-, ministero-, dext-ero-, sinist-ero-, dext-imo, &c. (see the next paper); in ust-ula from ur- (us-) 'burn;' and probably in agrest-i-, caelest-i-, terrest-ri, siluest-ri-, domest-ico-, modest-o-, for in these words I am inclined to believe we have derivatives from lost words with a neuter suffix in es. Thus modesto- and the verb modera-ri seem to point to a noun modus moderis as once coexisting with the noun modus modi, just as glomus -eris stood by the side of globus-i, and so led to the formation of glomerare. Precisely in the same way Pott (E. F. i. 235, note, ed. 1859) contends, with reason, that μενοεικήs, which is commonly derived from the neuter noun µένος, implies a form µένος of the second declension; and he treats in the same way είδοποιός and τειχοποιός. So too one must, I think, assume a masculine aimo-s to explain such forms as  $ai\mu o\beta a\phi \eta s$  and  $ai\mu o-\omega$ , rather than, as is usually done, refer them to the neuter aimar.

Add to the preceding list first arbust-um from arbos. The common doctrine that this is an abbreviation from arboretum is clearly an error, for arboretum itself is for arbor-ect-um, and so contains the diminutival suffix ec, of which there is no trace in arbust-um. It is under the same wrong view that some hold frutectum to stand for fruticetum, salictum for salicetum. Such a doctrine would lead us into an endless series; for if salictum is for salicetum, then, as salicetum must have grown out of a form salicectum, we

must again assume a fuller salic-icetum, and then a salic-icectum, and so ad infinitum.

The names of female agents, tonstrix, defenstrix, persuastrix, and the noun tonstrina, come from masculine nouns in or, tonsor, defensor, and persuasor, though the last is no longer to be found. The disappearance of the long o of tonsor -ōris might have been a difficulty, had we not the undoubted case of doctr-ina from doctor. Our sister, Germ. schwest-er. has the same suffix, er, as pater, mater, frater, and that probably a diminutival suffix of affection; while or has obtained a preference in sor-or (for sos-or) and ux-or, solely through the influence of the vowel in the preceding syllable, o and u. The pronoun ist-o- I would divide so as to leave o alone to the suffix, as in ill-o- and e-o- (eum, eam, &c.); but my reasons I must reserve for a more convenient occasion, as the argument would run to a great length. Vest-i- comes from a root uen or ues, as seen better in the Greek Fεν-νυμι, ημφι-Fεσ-μαι; but i alone belongs to the suffix, as also in part-i-, where it is a corruption of ic, as seen in part-ic-ula-.

Cust-od- I also claim as one belonging to this class, giving to it for its original meaning 'door-keeper.' The first syllable I believe to be an earlier and truer form of os (oris), except that, like ost-ium, it has thrown out a t. The disappearance of the initial guttural is what is already familiar in ubi, unde, uter, from cubi, cunde, cuter. The second element  $\bar{o}d$  I compare with the corresponding part of  $\theta\nu\rho$ - $\omega\rho$ -o- $\pi\nu\lambda$ - $\omega\rho$ -o-, which Buttmann deduces from  $\delta\rho a$ - $\omega$ , and I think with reason, so as to make them signify 'doorwatcher, or door-warden.' But a  $\rho$  is at times repre-

sented by a Latin d, as in caduceo- by the side of the Doric καρυκειο-. Even όρα-ω itself is of the same stock with the Latin uide-o, as proved by its aorist Fειδον, Fιδειν. Nay, I must also claim as one with the root of όραω, and so with that of ειδον, uideo, our own ware, wary, and with an excrescent d, ward, ward-en, and the French guard-er, &c. together with our own regard 'look back.' The etymology of custod- here proposed corresponds to that of aeditumus or aedituus, from tu-eor, or, as I am inclined to assume, an older tum-zor.

In French we have also instances that belong to this class, in *estre*, now *être*, by the side of the Ital. *essere*, in *naître* for *nascere*, &c.; as well as in the old French perfect *distrent*, by the side of *disrent*, now *dirent*. Possibly we owe to this principle the personal ending of our verbs, as *lovest*, where an s alone seems justified by the older branches of the Indo-European family. So in German we find *morast*, *palast*, *axt*, *einst* (see 'German for the English,' by Sonnenschein, &c.), as also *obst* supplanting an older *opaz*.

9. Bd:  $\mu o \lambda v \beta \delta$ -o-, which in this respect stands half-way between the Latin plumbo- and our own lead. The Latin uerber- I believe to be a compression of an older uer-eb-er-, and again the Greek  $\dot{\rho}a\beta\delta$ o- to have come by decapitation from a form  $Fa\rho$ - $a\beta\delta$ -o, so that the root-syllables are virtually the same, and the suffix which immediately follows it.  $Po\phi$ - $\epsilon$ - $\omega$  (for  $\sigma o\rho$ - $o\phi$ - $\epsilon$ - $\omega$ ) is of course one with the Latin sorbeo (for sor-ob-eo);

<sup>&</sup>lt;sup>1</sup> Those who are alarmed at this theory of decapitation are invited to compare the Greek  $\rho a\xi$  ( $\rho a\gamma$ -) with the Latin f(a) rag-um 'a (straw-) berry;' and indeed with our own berry, in which two weak vowels, e i, have superseded the strong vowels, a a.

but in Greek by the side of the compound  $a\nu a\rho\rho \rho\phi a\omega$  we find also  $a\nu a\rho\rho o\iota \beta\delta$ - $\epsilon\omega$ . 'E $\beta\delta o\mu o$ - when contrasted with the Germ. siebente seems to have an excrescent  $\delta$ . The Latin verb ped- might well appear in Greek as  $\beta\epsilon\lambda$ - or  $\beta\epsilon\nu$ -; but we find  $\beta\delta\epsilon\nu$ - $\nu\nu\mu\iota$ ,  $\beta\delta\epsilon\lambda$ - $\nu\sigma\sigma\omega$ , and an adj.  $\beta\delta\epsilon\lambda$ - $\nu\rho\sigma$ - (see Rd below). The Fr. coude was written in the sixteenth century as coubde, and so establishes its identity with the Latin cubito-.

10. Gd:  $\mu\iota\gamma\delta a$  by the side of  $\mu\iota\gamma a$ ; and it seems likely that  $\Gamma\eta\mu\eta\tau\eta\rho$  passed through  $\Gamma\delta\eta\mu\eta\tau\eta\rho$  on its way to  $\Delta\eta\mu\eta\tau\eta\rho$ .

11. Ld: here Diez (i. 194) supplies most of the following examples: Span. valdré; Prov. foldre (=old Fr. fouldre); toldre=tollere; Old Fr. mouldre, resouldre, pouldre, now moudre, resoudre, poudre. The Latin corulus passed first into colurus (r being supplanted by an l, and in the following syllable the converse); then colurus produced couldre, which is now coudre, a word which is therefore the genuine analogue of our hazel; Germ. baldrian = ualeriana; Du. helder = Germ. heller. Add to these our own ald-er = Lat. al-nus, where the English r represents the Latin n, just as is the case with order (Fr. ordre) compared with ordon-. So our old alder-first and aller-first correspond to such German compounds as aller-beste. Lastly, αλδ of αλδ-αινω, αλδ-ησκω some scholars identify with the Latin al-o.

12. Nd:  $a\nu\delta$ - $\rho$ os for  $a\nu\epsilon\rho$ -os;  $\epsilon\nu\delta$ -ov and  $\epsilon\nu\delta$ -os by the side of  $\epsilon\nu$ ; in Latin mand-are, pre-hend-ere, both from man of man-u 'hand,' for the m and h in these words represent each other, much as in Greek do  $\mu\epsilon\nu$  (whether the particle or the root of  $\mu$ o $\nu$ -os) and  $\dot{\epsilon}\nu$ -(nom.  $\epsilon$ is); tend-ere by the side of tene-re; in, the

Lat. prep. leads to ind-e 'down' (see p. 70), and also appears with a d in ind-igeo, indu-perator, endotercisus, &c. The pronoun is, ea, id had for its base in (see p. 70), and hence ind-e, of which e alone belongs to the suffix with the notion 'from' (see the following paper); so, ken or kun being the base of the relative, we have und-e (orig. cund-e), 'whence.' The Latin gerund scribend-um I hold to be in its first part one with the form scriben already spoken of (p. 212) as equivalent to the Germ. schreiben. In the French language instances abound, as cendre, tendre, Vendredi, viendrai, tiendrai, moindre, gendre. So the Spanish has pondré, tendré, vendré; the German, niemand, abend, and-er, mind-er, hund, Mailand for Milan, &c.; English, yond, beyond, mind, sound (sb. and adj.), thund-er, gand-er, kind, as well as kin (= gen of genus), compound; while our Henry (Henricus) appears in Scotch as Hendrick; and conversely bind, mind, find appear without a d in the Dorsetshire bin, min, fin. Latin words cale-, palam and palma, &c. polle- 'weigh,' praepolle- 'outweigh,' exhibit an l in the root-syllable, and an l is often interchanged with an n; but in Latin there is a tendency not to be satisfied with an n, but to add to it an excrescent d, the more so perhaps as the Latin is also fond of an interchange between l and d. Be this as it may, we find by the side of the words just mentioned cando, at least in compounds (accend-o, &c.) and derivatives as candela, pando, pendo, with pondus. Again, m and n being freely convertible, the Latin gemere, tremere, and an obsolete abemere 'to take down,' have led to the French geindre as well as gémir, craindre as well as crémir, and aveindre.

As regards the Latin verbs which end in ngere, it is

not altogether certain that the n is non-radical. Although the Latin iugum, coniugium, the German joch, and English yoke plead strongly in behalf of a mere guttural as ending the root-syllable, yet the Sanskrit gives us a form yun-aj-mi as the equivalent of the Latin iungo, which seems to imply that yun was one form of the root. This view seems to be confirmed by the fact that the French writes joind-re where the Latin has iung-ere; and similarly astreind-re, feind-re, peind-re, ceind-re, oind-re. As a d interchanges alike with n and l, it is no strange matter that we find the Latin uad-ere leading on the one hand to the French all-er, and on the other to the South Italian an-are; but here again the ordinary dialect prefers and-are.

13. Rd: an r and a d are often convertible, as is shown abundantly in Sanskrit and occasionally in Latin, for example, as was just observed, in caduceo- (m.) from the Doric καρυκειο- (n.), in cust-od- (see above) compared with  $\pi\nu\lambda$ - $\omega\rho$ -o, &c. Hence we should be the less surprised at a d growing out of an r, as in cor cord-is and καρδ-ια by the side of κεαρ κηρ-; ord-ior by or-ior; Latin mordeo- by the side of mol- 'grind,' Lith. mal-; burd-en from bear; murd-er from a root = Lat. morand Sanskrit mar or mri; gird by the side of the Latin giro- (written commonly gyro-); French tord-re by the side of Latin ter- 'turn' and torque-; our  $haggard = German \ hager.$  The Latin verb  $p\bar{e}d$ - may well have had ped- for its base, just as scrīb-, dīc-, nūb- are lengthened from the simpler forms scrib-(cf. conscrib-illo, Catul. xxv. 10, and γράφ-), dic- (malidico-) nüb- (pronüba, conübio-, νεφελη); and then this  $p \breve{e} d$ - might have for its Greek analogue  $\pi \epsilon \rho$ -, but we find  $\pi \epsilon \rho \delta$ . Again, l and r being convertible we have the equivalent forms al-ere and  $a\iota\rho\epsilon\iota\nu$  ( $a\rho$ -); but from alere come ard-uus and ard-ere. So also obsordescand obsolesc. (See the following paper.)

- 14.  $\Lambda\theta$ :  $a\lambda\theta$ - $\omega$ ,  $a\lambda\theta$ - $\eta\sigma\omega$ ,  $a\lambda\theta$ - $\epsilon\sigma\sigma\omega$  are said to be of the same stock with the Latin al-o; but should perhaps be connected with our heal. In either case the  $\theta$  is excrescent.
- 15.  $N\theta$ :  $a\nu\theta$ - $\epsilon\sigma$  from an old root  $a\nu$  'blow' (cf.  $\alpha-\eta-\mu\iota$ ), which the Sanskrit retains;  $\epsilon\nu\theta$ - $\epsilon\nu$ , of which the first  $\epsilon \nu$  alone belongs to the root, and the second  $\epsilon \nu$ alone to the suffix (see the following paper). As  $\nu$ and  $\theta$  are readily interchanged, for example, in  $\epsilon$ - $\mu a\theta$ - $o\nu$ compared with  $\mu \epsilon \nu - \epsilon \sigma$ ,  $\mu \epsilon - \mu \nu - \eta \mu a \iota$ ; in our oth-er, the compar. of one, in the Norse ann-ar and its pl. dat. öth-rum; in the Old English plurals loveth and loven, and the Old English adverbs henn-en and heth-en, I hold that the right way of explaining such forms as  $\mu a \nu \theta a \nu \omega$  by the side of  $\epsilon \mu a \theta o \nu$ ,  $\beta \epsilon \nu \theta - \epsilon \sigma$ - by that of  $\beta a\theta - \epsilon \sigma$ ,  $\tau \epsilon \rho \epsilon \beta \iota \nu \theta \sigma$  by that of  $\tau \rho \epsilon \mu \iota \theta \sigma$ , is to consider that  $\nu$  before the  $\theta$  in  $\mu a \nu \theta a \nu \omega$ , &c. corresponds to the  $\theta$  of  $\epsilon \mu \alpha \theta o \nu$ , &c.; and that the  $\theta$  which follows the  $\nu$  is excrescent. What I here say of  $\nu\theta$  I say also, mutatis mutandis, of  $\lambda a \mu \beta a \nu \omega$ ,  $\pi \epsilon \rho \delta \omega$ , &c. compared with  $\epsilon \lambda a \beta o \nu$ , ped-o, &c.
- 16. P $\theta$ :  $o\rho\theta$ -o- and  $o\rho\theta$ - $\rho$ o- 'dawn' from  $o\rho$  of  $o\rho\omega$   $o\rho\nu\nu\mu\iota$ ;  $\delta a\rho\theta$ - $a\nu\omega$  by the side of dor-mio, our dr-eam and dr-ow-sy;  $\pi o\rho\theta$ - $\mu$ o- root  $\pi o\rho$  as seen in  $\pi o\rho$ -o-,  $\pi o\rho$ - $\iota\zeta\omega$ , corresponding to our fare;  $a\rho\theta$ - $\rho$ o- (n.) and  $a\rho\theta$ - $\mu$ o- form  $a\rho$  'join;'  $\sigma\kappa a\rho\theta$ - $\mu$ o- from  $\sigma\kappa a\rho$  of  $\sigma\kappa a\iota\rho$ - $\omega$  'skip;'  $\tau e\rho\theta$ - $\rho$ o- (n.) 'an end' compared with  $\tau e\rho$ - $\mu$ a $\tau$ -;  $e\nu e\rho\theta$ - $e\nu$  from  $e\nu e\rho o$ -.
- 17.  $\Sigma\theta$ :  $\epsilon\sigma\theta$ - $\lambda o$  = Doric  $\epsilon\sigma$ - $\lambda o$ -;  $F\epsilon\sigma\theta$ - $\eta\tau$  = Latin uest-i- from a root  $\epsilon\nu$  or  $\epsilon\sigma$ ;  $o\pi\iota\sigma\theta$ - $\epsilon\nu$  compared with

οπισ-ω; εντοσθ-ι with εντος. Again, as  $\theta$  and  $\sigma$  are convertible, τυπτομεθα has substituted a  $\theta$  for the  $\sigma$  of the Doric τυπτομες, while τυπτομεσθα has preserved the  $\sigma$ , out of which a  $\theta$  has grown. So  $\iota\theta$ -ματ- 'a road' and  $\iota\sigma\theta$ -μο- co-exist; μαθ-αλλιδ- 'a sort of cup' and μασθ-αλιδ-; εσθ-ιω by the side of es-se es-ca. The Greek  $\sigma\theta$ εν-εσ- too is probably of the same stock with our sin-ew, as also with the Greek noun  $\iota\nu$ - (nom.  $\iota$ s) of the same meaning, or rather  $F_{\iota\nu}$ -, for this noun and uir- of the Latin uires seem to owe their digamma to an old form  $\sigma$ F $\iota\nu$ -.

18.  $\Phi\theta$ : the  $\theta$  of  $\phi\theta\epsilon\gamma\gamma\omega$ ,  $\phi\theta\epsilon\iota\rho$ ,  $\phi\theta\iota\nu\omega$ ,  $\phi\theta\alpha\nu\omega$ ,  $\phi\theta\sigma\nu$ os, as compared with  $\pi \tau o \lambda \iota s$ ,  $\pi \tau o \lambda \epsilon \mu o s$ , can scarcely be other than excrescent. In the adj.  $\epsilon \lambda \epsilon \nu \theta \epsilon \rho o$ - we virtually have  $\epsilon \lambda \epsilon \phi \theta \epsilon \rho o$ , which there can be little doubt is one with the Latin libero-, the b of which represents the  $\phi$  of the Greek word as usual. Consequently the  $\theta$  is excrescent. As for the  $\epsilon$  of  $\epsilon \lambda \epsilon \nu \theta \epsilon \rho \rho$ - it is not a mere euphonic vowel, as is commonly taught. On the contrary, libero- has lost what the Greek has retained. At the same time, both have suffered decapitation, loebero- (I prefer dealing with the older form) standing for sol-oeb-ero- or sol- $\bar{u}b$ -ero (for oe and  $\bar{u}$  seem to have had the same sound, as they now have in Dutch). Thus we come to what is almost identical with sol-ub-ili-; and ελευθερο- may well have grown out of έλευθερο-, the asperate having eventually disappeared in consequence of the neighbouring  $\theta$ . The Latin *ub-er-* originally 'a stream,' as is shown by the *ubera mammarum* of Lucretius, as well as by the common phrase ubertim lacrumare and the use of ubertas for 'a flow of words,' is immediately related to the verbs um-esco uu-esco. Hence the genuineness of the labial is established; and consequently a preference should be given in Greek to  $ov\phi a\rho$  over  $ov\theta a\rho$ , the latter having probably grown out of a fuller form  $ov\phi\theta a\rho$ .

- 19.  $X\theta$ :  $\delta\iota\chi\theta a$   $\tau\rho\iota\chi\theta a$  for  $\delta\iota\chi a$   $\tau\rho\iota\chi a$ ;  $a\chi\theta$ - $o\mu a\iota$  by  $a\chi$ - $\epsilon\sigma$  and the Sanskrit sah. The g of the Latin vb. rug-io, as in leones rugiunt, should have for its Greek analogue a  $\chi$ ; and accordingly we have  $\beta\rho\nu\chi$ - $\omega$  and  $\beta\rho\nu\chi$ - $ao\mu a\iota$ ; but we also find  $\dot{\rho}o\chi\theta$ -o- 'roaring;' and again by the side of  $o\rho\epsilon\gamma$ - $\omega$  there stands  $o\rho\epsilon\chi\theta$ - $\epsilon\omega$ . In  $\iota\chi\theta\nu$  and  $\epsilon\chi\theta$ - $\rho o$  the  $\theta$  is probably excrescent.
- 20. Cs, Sc, Gs, Sg: the sibilant being often interchangeable with a guttural, we find that the guttural on the one hand often throws out a sibilant, and conversely a sibilant a guttural. Hence cum ξυν and συν; κοινος and ξυνος; μιγνυμι μισγω, misceo, mistus, and our mix; augeo and aυξανω with our wax; εκ and εξ in both Greek and Latin; ξηρος and σκιρρος; ιξος and uiscum. Thus the second of the two consonants in the four combinations seems to be excrescent.
- 21. Ns: by the side of  $\chi\eta\nu$  the German has gans and the Latin has ans-er, which, like our own gand-er and the German gäns-er-ich, was in strictness applicable only to the male bird, er being a male suffix, as in the German kat-er a 'tom-cat.' The prep.  $\epsilon\nu$ s has probably only an excrescent  $\sigma$  attached to the ordinary prep.  $\epsilon\nu$ .
- 22. Rz, Lz, Tz: as in German herz=cor; kurz=our short; schmerz=smart; salz=salt; malz=malt; katze=cat; ratze=rat; hitze=heat; zu=to and too; zwei=two.
  - 23. Pf: in German, as pfad = path; pfahl = pale;

pfand = pawn, &c.; apfel = apple; stöpfel = stopper; tropf-en = to drop.

- 24. Mb: μεσημβρια for μεσημερια; μεμβλωκα for μεμολωκα; French chambre from camera-; humble from humili-; nombre from numero-; combler from cumulare; Spanish nombre from nomine; hombre from homine; hembra from femina. Again, as n and m interchange, we have in Greek ανδεν- = Latin imbu; Italian and-are with Latin amb-ul-are, and with German wand-el-n and wand-er-n; Greek γαστ-ερ-, Latin uent-er-, but English womb, Scotch wemb, the last used of the belly generally; English loins, German lende, but Latin lumbi. Add with a silent b, which however was probably once pronounced, our lamb = German lamm, our thumb = German daum.
- 25. Mp: Latin templum and extemplo with extempulo by the side of τεμενεσ-, all from a root τεμ- 'cut,' whence  $\tau \epsilon \mu \nu - \omega$ ; temp-os-, temp-era-re, &c. from the same root. Other familiar examples from Latin are sumpsi, sumptus, ademptus, contempsi, hiemps; while in English we have the equally familiar Thompson, Simpson, Hampton. To these add the English hump with a dim. humm-ock; stump by the side of the German stumpf and a dim. stumm-el. Again, as m and ninterchange, we have Latin tund- = our thump; as mand the guttural n (ng) interchange, our stamp =stingu-, better known in ex-stingu- 'stamp out' (fire), di-stingu- 'stamp differently.' M seems to have a stronger affinity for b than for p. Thus if we find an excrescent p making its appearance in the middle of words, the preference given to it over a b seems in some measure due to the influence of a following s or t. At any rate, it is for the most part in such com-

pany that the p presents itself. At the end of words a p is the less strange, since medials in this position are habitually pronounced as tenues.

26. Ng: in the simple strong, long, the final is but a nasal n, but takes to itself a distinct guttural sound in strong-er, strength, longer, length.

27. Rn: if the *n* of the German fern 'far' had been a suffix, it would not have passed into the comp. fern-er. I am disposed then to regard the *n* of stern also as excrescent. In the cases of mourn, burn vb., burn sb., turn, it is of course clear that the *n* is no part of the root, seeing that we have the Latin maere-, bur- of com-bur, and bustum, our dim. br-ook, and ter- in Latin; but whether it be excrescent or the remnant of a suffix it is difficult to decide. In the case of the vb. burn, the German brenn-en and our own brand seem to be evidence that the *n* is referable to a suffix.

In putting together these examples I have omitted some classes of words which might well have been inserted, because the question involved some matters which required a full discussion. Many of these will appear in the next paper. On the other hand some apology may perhaps be thought due for inserting examples of processes so familiar as what is seen in  $av\delta\rho\sigma\sigma$  and  $\mu\epsilon\sigma\eta\mu\beta\rho\iota\alpha$ . The purpose was completeness.

## XI.

## ON FALSE DIVISION OF SUFFIXES.

THE number of suffixes in verbs, nouns, and particles has been unduly multiplied, as it seems to me, through various errors, which I propose to consider under several heads. First of all many of those which are supposed to be independent of each other are simply varieties of the same. Thus there is no substantial distinction between the neuter substantives of the Latin and Greek languages which take for their consonant an s, r, n, or t with various vowels, as τερ-ασ- τερατ-ος, ονοματ- ονοματ-ος,  $\sigma\theta$ εν-εσ-  $\sigma\theta$ εν-ε-ος, ηπ-aρ- ηπaτοs, νδ-ωρ, νδaτ-οs; opes--eris, frigos--oris, ub-er- -eris, rob-ur- -oris, fulg-ur- -uris, ungu-en--inis, nom-en- -inis. Whether such a form as ονοματgrew out of an older ovoµavt-, itself deduced from an earlier ονομαν- by the outgrowth of a τ, is of little moment for the present question. The free interchange of the four consonants just enumerated appears partly from the words themselves, and is further confirmed by the appearance of ovoquaive by the side of ovoquar-, as also by such changes as appear in σωφρον- and σωφροσυνη, and the Latin pl. femina by the side of femur.

In the same manner there is no substantial difference in the liquid suffixes of the German fess-el (f.), deg-en (m.), and mess-er (n.), for these liquids are apt to inter-

change, so that we ourselves have as equivalents for two of them fetter and dagger.

A second cause through which the number of suffixes is unreasonably increased is the confusion by which a compound suffix is taken for a simple one. Thus in  $\tau \epsilon \mu - \epsilon \nu - \epsilon \sigma$ , fac-in-os-, and the oblique cases it-in-er-is, iec-in-or-is, two distinct suffixes have been united. The  $\epsilon \nu$  or in of these words may have been due to a secondary verb, as seems probable in the case of the first, since the form  $\tau \epsilon \mu' \nu - \omega$  is in common use. The same is possible in the case of fac-in-os-, for the Latin language also has many secondary verbs in in, as sper'n-o, po(s)'n-o, &c.; corresponding to our own reck-on, op-en, and the Greek  $\mu a \nu \theta$ -a $\nu$ - $\omega$ ,  $\lambda a \mu \beta$ -a $\nu$ - $\omega$ . On the other hand, the nouns ungu-en-, fem-en-, nomenalso possess such a suffix. But this is a matter which may be left open. When the vowel before the n disappears, as in uol-'n-es- (from uello), pig-'n-os- (from pango), there is a still greater tendency to consider nes (nos) as a simple suffix. So also I believe that the ion of opinion-, &c. is one with the ig-on of vertigon-, origon-, and so the analogue as regards suffix of such German nouns as ver-ein-ig-ung, a word which might have been represented by a Latin per-un-i-on. Indeed the Latin actually possesses the simple un-ion- 'a little one,' sometimes applied to a single one in a necklace of pearls, sometimes to a single one in a rope of onions. Our own language too abounds in cases where a compound suffix is not seen to be a compound. Thus English grammars speak of ling, lock, let, kin as though they were simple, when in fact they are all shortened forms, standing severally for el-ing, el-ock, el-et or rather el-ick, and ick-in. That el is itself a

suffix of diminution is abundantly proved by such substantives as nozzle, speckle, thimble, as well as the adjectives litt-le, mick-le; while ing alone is seen in farth-ing 'a little fourth,' tith-ing, lord-ing; ock or ick in butt-ock, rudd-ock, or ridd-ick (Jennings) 'a redbreast,' fist-ock 'a little fist,' as once used, mamm-ock, and no end of words in the Scotch dialect. I have purposely passed by hillock and bullock, because here an l might have been by some claimed for the suffix. The suffix et is seen in not a few words, as cygn-et, sign-et, giml-et, emm-et; but this suffix is probably a corruption of an older ock or ick.

It is not however denied that nowadays let and ling are often added to a word per saltum.

Another fertile source of error lies in the habit of what Mr. Whitley Stokes calls 'Provection,' a word which may well take a place in the nomenclature of Philology. He applies this term to what occurs in such a phrase as for the nonce, where the n has been unduly transferred from the preceding word, the more correct form being for then once 'for this once.' Similarly the tone, the tother grew out of that one, that other. What is seen here in distinct words also applies to the prevalent error of treating  $\mu a \tau$  in Greek and men in Latin as simple suffixes, for ovopat-, nomen, tegumen, and tegumentum should be divided ov-ou-aror  $ov-v\mu-a\tau$ -, g(o)n-om-en, teg-um-en, teg-um-ent-um. That at in the Greek noun and en in the Latin are in themselves suffixes is shown by the words already given,  $\dot{\eta}\pi$ -a $\tau$ -os and ungu-en-. On the other hand, umis sufficiently familiar in bell-um, &c. and virtually in the Greek  $\epsilon\rho\gamma$ -ov, &c. Again, that  $\mu$  does not belong to the suffix of aiµar- seems to be proved by its appear-

ance in aίμο-ω, which implies a sb. aίμο- (m.). I have elsewhere (Philolog. Trans. 1856, p. 341) given some of my reasons for believing that the suffix um of Latin neuters had in origin a guttural rather than an m. In our own language the guttural asperate ough is often pronounced as a labial asperate, as rough, cough, &c. So in different parts of England we have at the present day the three terms shock, shoof, and sheaf applied to the same object. On this view there is nothing strange in the fact that bellum, apium, and Ilium should lead to adjectives bellic-us, apiac-us, Iliac-us; or that apium and allium should in German take the forms eppich and lauch, in English leek; and conversely that the Greek πυνδακ- and Latin podec-1 should in English be represented by bott-om as well as butt-ock.

It is strange to find Madvig in his 'Bemerkungen' (Brunswick, 1844) putting forward the doctrine that an accusative case in Latin has no true suffix, the final m being, he says, a mere euphonic addition, while the ν of Greek accusatives he disposes of in the most summary manner by calling it ἐφελκυστικόν. Thus he says, 'The accusative is only the theme "euphoniously modified." In this way he accounts for the identity of such forms as nom. lignum and acc. lignum. My own conviction, as I have said, is that bellum has grown out of an older bell-ogh, which eventually passed also into bello, so as to enter the second declension.

¹ More strictly fundo-, but this I hold to stand for a fuller fundoc-. How readily a suffix oc may pass into a mere o is seen in the Scotch winnock and our more corrupt wind-ow, haddock the fish, also called haddow. Indeed the suffix ow of our language, which to the ear is but an o, has perhaps always grown out of a guttural.

If what I have said be true, the adjective bellic-us was in origin a mere genitive, 'of war,' though in the end compelled to undergo inflection, precisely as happened to the genitive cuius of the relative, which at one time the Romans had the courage to decline as cuius a um.

I proceed to other cases of what I regard as Provection, in which the letter t plays a very important part, while c and b also occur; and in order to suggest a doubt as to the propriety of the division usually put forward, I place by the side of each suffix examples which exhibit no t, c, or b. Thus to tion of lectio, aratio, I oppose ion of legio; to tat of bonitat-, at of sat-iat- and uolunt-at-; to tela of tutela, ela of querela; to itia of auaritia, ia of miseria; to itie of canitie-, ie of desidie-; to tudon of multitudon-, udon of hebetudon-, and edon of dulcedon-; to ti of morti-, i of torqui-; to tut' of seruitut-, iuuentut-, ut of salut-; to itio of servitio-, io of remigio-; to tro of claustro-, aratro-, ro of fulc-ro-; to ta of nauita, a of incola; to tu of partu-, conventu-, i of man-u-, ac-u-, portic-u-. These for substantives; and then for verbs; to ta or ita of ducta-, clamita-, a of sona-, tona-; to tita of lectita-, ita of clamita-; to tula of ustula-, ula of ambula-; to tilla of cantilla-, illa of sorbilla-. So for adjectives: to terno of sempiterno-, erno of hiberno-; to turno of diuturno-, urno of diurno-; to tili of aquatili-, uolatili-, and bili of amabili-, flebili-, utibili-, nobili-, uolubili-, ili of riuali-, facili-; to bundo of saltabundo-, querebundo-, nitibundo-, and to cundo. of iracundo-, uerecundo-, rubicundo-, the mere undo of sec-undo-, regundo-, oriundo-; to tiuo of captiuo-, iuo of uociuo-; to tico of aquatico-, ico of ciuico-; to

ceo of rosaceo-, eo of aureo-; to cio or tio of tribunicio-, io of regio-; to ceri of alaceri-, uoluceri-, to beri of luguberi-, and to teri of compesteri-, the simpler eri of ac-eri-; to cero of ludicero-, ero of pig-ero-, rub-ero-; to tero of dextero-, σοφωτερο-, ero of supero-, ενερο-; to timo and τατο of superlatives, imo and ατο of minimo-, μεσατο-. So also for diminutives, whether substantives or adjectives: to culus a um of sermunculus, sororcula, corpusculum, breuiculus, ulus a um of regulus, barbula, scutulum, hilarulus.

Now in all these the error called Provection has been at work. In other words the c, b, t, assigned to the suffix, belongs properly to the preceding syllable. The foundation of my argument is of so extensive a character that here I can do little more than refer to the two papers 'On the Representatives of the Keltic Suffix Agh or Ach "little," in the Latin Vocabulary,' in the Transactions of the Philological Society for 1856, pp. 295—354, and to the preceding paper, 'On English Diminutives,' pp. 219—250. Of the former of these a summary was also given in the second appendix of my Latin Grammar. The result will be found to be, that, while I find the suffix ag in its full form in plag of plango, in frag of frango, in strag of strag-es, stragulus, whence straui, stratum, in uorag of uoragon, &c., and but little changed in trah of traho traxi, the vowel is modified in frug- of fruges by the side of fruor and fructus, in fug- (for flug, cf. the Germ. flieh-en, flucht). On the other hand the medial g is exchanged for a tenuis in orac-ulum, lauac-rum, verec-undus, ridic-ulus, uoluc-ris, inuoluc-rum; or retained, but with the loss of its vowel, in spara-,

terg-, merg-, uerg-. A second change I assume is the passage of  $a\chi$  into  $a\phi$ , as in  $\gamma(a)\rho - a\phi - \omega$  by the side of  $\chi \alpha \rho - \alpha \chi - (\chi \alpha \rho \alpha \sigma \sigma \omega)$ , cf.  $\tau \alpha \rho \alpha \chi \eta$  from  $\tau \alpha \rho \alpha \sigma \sigma \omega$ ). Our own laugh, with its written guttural but sounded labial, when contrasted with the German lach-en, is another distinct example, and one the more valuable as it is taken in the act of transition. But a Greek  $\phi$ has generally for its Latin analogue a b. Hence scrib-o; and indeed the Greek language itself at times exhibits a  $\beta$ , as in  $\theta \circ \rho \circ \beta \circ \delta$  by the side of ταραχη, and also in  $\tau \rho \iota \beta \omega$  from a root  $\tau \epsilon \rho$ . Indeed, the Latin also must once have had a secondary verb, ter-ib- or ter-eb-, by the side of ter-, for so only can we account for the nouns trib-ulum and tereb'ra, as also for the forms tri'ui, tri'tus. In this way I would explain the Latin mir-ab-ili-, dol-ab-ra-, fl-eb-ili-, teneb-ra-, illec-eb-ra-, cr-ib-ro-, (g)n-ob-ili-, uol-ub-ili-, sol-ub-ili-, and the vb. ql-ub-.

The assumptions I am making may appear to be over-bold, as I claim not merely a change of the consonant, but a change without limit for the vowel. But it should be observed that the change of vowel obeys something like a law, inasmuch as the assumed vowel is, in a large majority of instances, that which is one with, or if not so, still in keeping with, the root-vowel; and this doctrine of vowel-assimilation demands attention for perhaps all languages. As an instructive example, I point to a family of substantives in some of the chief Indo-European languages, where the leading idea is that of a living creature small or young, viz.  $\pi\omega\lambda$ os 'a young horse,' pullus 'a young horse or a chicken,'  $\pi a\lambda\lambda a\xi$  'a young man,' pellex literally 'a young woman,' but employed as a

euphemism for 'a concubine,' fillie 'a young mare,' pollock a Scotch term for 'a young fish or crab.'

So far I have taken into consideration the use of the suffix ag, &c. in Latin and Greek verbs only. But it also plays its part in the formation of nouns, both substantives and adjectives; and here I was encouraged in the outset of the inquiry by finding that Pott had demonstrated by a large induction that an is a Greek suffix of nouns signifying 'little,' while I also found ec performing the same duty in Latin and the Slavonic language, and our own too has clear representatives of the same suffix, which take a great variety of forms, but all proceeding, I think, from an original ock, as bullock. The Latin nouns cim-ec- 'a bug, pul-ec- 'a flea, cul-ec- 'a gnat, are unmistakeable diminutives, although the primitives have ceased to exist. But with us, as with the Greeks and Romans, the guttural passes into other sounds. As they gave admission to γραφω and scribo, so the German has grab-en, and we both grub and grave. Hence I cannot but treat the f of calf, half, turf (for which the Scotch has a simple toor) as standing for af or oof, and so a diminutival suffix.

But not unfrequently with us a final guttural disappears altogether, though at times it leaves for the eye its ghost, in the shape of a silent y or w. Thus we have shad-ow for 'a bit of shade,' haddow, window, by the side of haddock, and the Scotch winnock, way, day, say, any, honey, corresponding to the German weg, tag, sagen, einig, honig.

With this evidence from our own island, I venture to put forward the startling doctrine, for those at least who now hear it for the first time, that all the vowel conjugations of the Greek and Latin verbs, and all the vowel declensions of their nouns, have grown out of older forms, with the guttural suffix ac or ag more or less modified. Hence I account for the eighteen Latin neuters in aculo- or acro-, as sub-lig-ac-ulo-, lau-ac-ro-, for the ab in the four hundred adjectives (I give this number after duly counting them) in ab-ili-, as mirab-ili-; also for the frequentative participles, over sixty in number, such as plorab-undo-, contionab-undo-, gemeb-undo-. Here the suffix is fitly employed, since we also, as Dr. Johnson points out in his 'Grammar of the English Language,' employ our diminutival el or le in the formation of iterative verbs, as sparkle, gamble, or gambol.

On the principle here put forward, the vowel verbs of Latin should exhibit some traces of the same meaning; and I see such traces first in such verbs as frica-re, laua-re, tona-re, all of which deal with actions which are commonly repetitive, while the simple verbs lauĕre and tonĕre are not unknown to the older language, and frictus fricui again implies a consonant verb fric-. Moreover, as in the Slavonic languages verbs fall into two classes, which their grammars call 'momentary' and 'continuative,' so the Latin vowel verbs, where they fail to mark iteration, are distinctly employed for what is akin to this idea, that of continuity, as in stare (for set-a-re, as opposed to the simple set, seen in si-s(e)t-o, which denotes the momentary act of stopping); in sede-, iace-, pende-, as opposed to sid-, iac-, pend-; in uide- 'see;' in s(e)c-i- 'know,' from a lost sec-, corresponding to seh of the German sehen 'to look at.' Here, however, the original meaning was probably of a physical

character; and, if so, we should identify the root with sec of sec-are 'cut,' in which case we should have what is parallel to cerno 'I sift or separate,' and to uideo as compared with diuid-o 'I separate.' But both Greeks and Romans, though without the simple verb sec  $(\sigma \epsilon \kappa)$ , have deduced from it, by the addition of the very suffix we are discussing, a secondary sekek; which, offensive by its repeated guttural, led to the substitution of a labial for one of them, and so supplied the Greek language with its  $\sigma' \kappa \epsilon \pi$ -, and the Latin with its s' pec-.

As to nouns, the adjective rosac-eo-, to take this as representing a class, when compared with aureo-, receives its explanation so soon as we look upon ros-a- as having grown out of a fuller ros-ac-, which is nearly identical with the Greek diminutive ροδ-aκ-. Similarly tribunic-io- may well have been deduced from an older tribun-oc-, or tribun-ic-. In the adjective aprug-no- from apero-, the guttural happens to have been preserved. Similarly ciuic-us and bellic-us have, in the us alone, the suffix which constitutes them adjectives; this suffix being probably, as I have already hinted, one with the ordinary suffix of the genitive as seen in the Greek σωματ-os, &c.

I have not so far appealed to an argument which seems to me of much weight, that, in all languages, diminutives have the habit of supplanting the primitives from which they sprang. Thus fratello, sorella, in Italian, soleil, abeille, in French, sparr-ow in English, and sper-ling in German, though evidently in origin diminutives, stand now alone in their respective languages; and again the primitive stare, of which star-ling is the diminutive, is almost obsolete.

What has been said of Latin substantives is equally applicable to Latin adjectives; and strangely enough the whole Latin vocabulary fails to present us with a single 1 original adjective of monosyllabic form, all such simple adjectives having been superseded by words which have assumed a diminutival suffix. quently all are disyllabic, or still longer. There is one apparent exception to this assertion in trux trucis; but this is only a compression of tor-uc- with the guttural suffix in unusual purity, and even this had by its side the double diminutive tor-u-o- for tor-uc-o-. This general formation of diminutival adjectives seems to be the result of something like a feeling of modesty, a desire to keep within due bounds. The Romans would not say without qualification that a thing was absolutely long. It was 'somewhat long,' 'rather long than not,' or, as in familiar English we say, 'long-ish.' Thus in Latin breuic-ulo- is the more correct division, breui- itself being but a curtailment of breu-ic-. So we also have adjectives in our yell-ow, shall-ow, holl-ow, call-ow.

But it is common for a c to give place to a t, as has been more than once noticed in these pages (see pp. 75, 227); and this especially in the case of diminutives. Hence in breuit-er, er alone is strictly speaking the suffix, which probably grew out of an older es, if we may argue from the general habit of the language. Now, when Plautus wished to give to the Greek adverbavevoxn $\mu\omega s^2$  a Latin dress, he wrote ineusceme. But the Greek  $o\dot{v}\tau\omega s$  had also the shortened form  $o\dot{v}\tau\omega$ , so

<sup>1</sup> Except perhaps par, which however has a pl. par-i-a.

<sup>&</sup>lt;sup>2</sup> Trin. iii. 1, 24 (see my paper on Ritschl's Plautus, Philolog. Trans. 1860-1, p. 178).

I venture to suggest that as the Greek suffix  $\omega s$  was reduced to  $\omega$ , so my assumed Latin suffix es was to e, as seen in *ineusceme*, docte, &c. Nay, we may go one step farther, and identify the assumed suffix es with  $\omega s$ , the  $\bar{e}$  with the  $\omega$ , since the Latin had certo, uero, &c. as adverbs by the side of certe, uere; and the same interchange of these long vowels is seen in  $a\pi a\tau \omega \rho$  and  $\pi a\tau \eta \rho$ , our  $\eta \tau \omega \rho$  and our  $\eta \tau \eta \rho$ , Anio and Anienis. Thus I am disposed to contend for the identity of the three adverbial suffixes er (for es) of breuiter, e of docte, o of vero, both with each other, and with the Greek  $\omega s$  and  $\omega$  of  $o\dot{\nu}\tau \omega s$ ,  $o\dot{\nu}\tau \omega$ .

The cases of canit-ie-, auarit-ia- are also cases where a t has superseded a c, and indeed the forms in ic, canicie-, auaricia-, have good manuscript authority, though not the best, and they are to the present day preserved in the Spanish vocabulary. Nay, the comparatives tristic-ior, iustic-ior, laetic-ior so frequently present themselves in manuscripts of the second order in place of the orthodox tristior, iustior, laetior, that it seems to be a safe conclusion that such forms were in provincial use. (See the paper already referred to, p. 346.) Thus we have direct evidence in favour of the forms tristic-, iustic-, laetic-, from which tristic-ia, iustic-ia, laetic-ia would be duly formed.

What has been said of these words applies of course to the classes represented by bonit-at-, multit-udon-, seruit-io-, nauit-a-. So also as regards the frequentatives in ita, as clam-ita-, it may justly be contended that it-a is a double suffix of diminution standing for ic-a. Indeed the verbs uell-ic-a-, fod-ic-a-, morsic-a- have preserved the guttural. No doubt the fre-

quentatives in ita form a very large majority; but these are mtters, as I have said before, not to be decided by numbers; and further, there was a special reason why many of them should prefer to substitute ita for ica, as having already a preceding guttural, as clamita- for instance, agita-, and quaerita-; I say 'many,' after counting over three hundred so constituted, and a combination of three hundred might well lead to something like a law for the others.

The same applies to the so-called supines, or nouns of the *u* declension, which have a short vowel before the *t*, as fremitu-, gemitu-, crepitu-; as also to such nouns as position-, exposition-. Indeed in ration- we know, from our own verbs reck and reck-on, that a guttural is the more genuine letter. So again with the noun sation- a guttural may be claimed as having preceded the *t* on the strength of our verb sow with its final w. For condition- and dition- the case is clear, as the older forms are now known to have been condicion- and dicion-. Lastly in red-it-u-, ad-it-u-, &c. the *t* is an original part of the root, as shown by the forms it-er, ex-it-io-(n.), in-it-io-, com-it-, ped-it-, &c.; and the old verb per-bit-ere, &c.

In many cases, however, the appearance of a t, no way belonging to the suffix, seems to admit of its true explanation in the theory that it is excrescent. I refer to such forms as lect-ion-, cant-ion-, capt-ion-, assert-ion-, ust-ion-, gent-i-, mort-i-, uest-i; cant-u-, iact-u-, quest-u-, part-u, salt-u-; iuuent-ut-, uirt-ut-, senect-ut-; and the verbs lect-ita-, ust-ula-, cant-illa-. But not so in capt-iuo-, &c. for such an adjective denotes the belonging to the class of men capti or things capta, so that a perfect participle is called for, which is not

the case with the nouns in *ion* and *u*, for these speak only of an act in progress, not of an act completed.

But there remain for consideration the cases in

But there remain for consideration the cases in which a t is preceded by a long vowel, as aration-, uolatili-, aquatili-, aquatico-. All these I would explain on the same principle which was applied (p. 208) to ōtio-, diūtius, sētius, viz. that the older forms had a c before the t, and that the t itself was an outgrowth from this c, the several words being deduced from ar-ac-, uol-ac- (cf. uoluc-ri-), and aqu-ac-.

Again, I am disposed to transfer from the suffix to the verb the t which precedes or in the names of agents, as arat-or, act-or, duct-or, rapt-or, past-or, cant-or, sart-or, the or itself being only a variety of uir, just as the Welsh has barf 'beard,' barf-wr 'barber;' mor 'sea,' mor-wr 'sailor;' pryn-u 'to buy,' pryn-wr 'a buyer;' pechod 'sin,' pechad-wr 'sinner' (one of course with the Lat. peccat-or). And these Welsh forms are, I believe, generally regarded as containing the word gwr 'man.' But if I thus treat t of the above Latin words as excrescent, what is to be done with the Greek names of agents, such as ount of the word t My answer is simply this, that they should be dealt with in precisely the same way, the t being attached to what precedes. One advantageous result of this view is that the French forms such as taill-eur, brass-eur become intelligible; and further that the Teutonic branches fall into agreement with the classical languages as regards nouns in or, er, like our sail-or, dealer, and the Germ.  $k\ddot{u}f$ -er, t

I have yet to deal with comparatives and superlatives, and to justify the division  $\sigma \circ \phi \omega \tau - \epsilon \rho \circ - \delta \epsilon \iota \nu \circ \tau - \epsilon \rho \circ -$ 

imo-, int-imo-, &c. (p. 120), as contrasted with the prevailing habit of assigning the t to what follows. What I subsequently said in the same paper will more than prepare the way for my defence. It may be remembered that, starting from the suffix iov of Greek, ior (ios) of Latin comparatives, I called in aid the doctrine of Bopp, that these two suffixes were apt to lose one of the two vowels, an i being lost for minor and minus, and secus as superseding secius (cf. p. 122), to which I might have added the Latin prim-ores (for prim-iores) and the Greek  $\pi\lambda\epsilon$ -ov for  $\pi\lambda\epsilon$ -iov, the ple-ores of the Carmen Arvale, and plus or rather plous itself, as a contraction of pleos, and lastly the theoretic op-os, afterwards post, of the same paper. On the other hand, we have but the i in magis, nimis, satis, pristino-; probably also in  $o\pi$ - $\iota\sigma$ - $\omega$ , more certainly in  $\pi\rho$ - $\iota\nu$ , which, though short in later writers, has often a long It has been said indeed that the vowel in Homer. vowel is 'properly' short; but surely the authority of Homer is for the present question more weighty than that of any number of later poets; and indeed generally it may be asserted that the passage from long to short vowels is more in accordance with reason and with the history of language. Thus πριν may well have grown out of  $\pi \rho$ - $\iota o \nu$ , i. e.  $\pi o \rho$ - $\iota o \nu$ .

In the same paper I pointed to the fact that both in Gothic and the younger German languages the same appearance, sometimes of i (e), sometimes of o, is the universal characteristic of comparatives, as ald-iz-a, minn-iz-a, together with frum-oz-a, frod-oz-a in Gothic, alt-ir-o (alt-er-o), menn-ir-o (menn-er-o), with jung-or-o, frot-or-o in Old German; and from this I drew what I deemed a reasonable inference, that these

Teutonic suffixes grew out of an older suffix ios or ioz (ior). The Greek and Latin suffixes differ indeed in the one having a  $\nu$ , the other an s(r); but this is a distinction which must not be regarded as affecting their identity, seeing that it is in obedience to a law which subsists between the two languages (see p. 163); and indeed the Sanskrit serves as a connecting link with its fuller suffix iyans (Bopp, V. G. ii. pp. 32, 35), which at the same time accounts for the long i in the Greek com-parative.

But, as I said in the former paper, no one can for a moment separate the suffix of Modern German and our English comparatives, as in ält-er, old-er, wis-er, from the er of the Old German alt-er-o, &c.; nor this again from the classical  $\epsilon \nu - \epsilon \rho - o\iota$ , sup-er-i, inf-er-i. The word ' $\tau - \epsilon \rho - o$ - 'one of two,' proclaims its intimate connexion with the numeral  $\xi_{\nu}$  one, both by its meaning and by its asperate, for the Greek language stands apart from all its congeners in giving an asperate to these two words. Then as to the change of consonant we have the same in our old bet-est from a root ben, and, what is still more to the purpose, the Danish has alongside of each other en as m. and f., et as neuter for the indefinite article, which of course is but the numeral one. We are taught indeed that the t in this and other words is a neuter suffix; but in fact such a thing as a neuter suffix has no existence, all that characterises a neuter being the loss of some final consonant, and not any addition. A change of n and t is seen not merely in the Norse participle m. haldinn (for haldins), f. haldin, n. haldit, but also in our own hold-en, clov-en, as compared with the Scotch abas-it, English clef-t, and with the

Latin *pos-it-o-*. Of course a classical *t* according to Rask's law should appear in our tongue as *th*, and accordingly the comparative of our *one* is *oth-er*.

Again, so far as regards the Teutonic family, it is the common doctrine, and one which I think cannot be disputed, that superlatives are formed from the comparative, and not directly from the positive. the French le meilleur too this is self-evident; as also in the Lapp anek 'short,' anekub 'shorter,' anekumus 'shortest,' which throw light upon the Latin superlative. The same theory accounts for the forms μεγιστος, βελτιστος, where μεγις, βελτις, following the analogy of Latin comparatives, have given a preference to the  $\sigma$  over  $\nu$ . It matters little whether we divide these as  $\mu \epsilon \gamma \iota \sigma \tau \sigma s$ ,  $\beta \epsilon \lambda \tau \iota \sigma \tau \sigma s$ , or treat the  $\tau$  as excrescent, inasmuch as both 70s and 0s are well fitted to represent the Greek article, so that βελτιστος will exactly correspond to the French le meilleur. Such a position for the definite article is the ordinary construction in the Scandinavian family, and by way of example I give the Danish patriot-en 'the patriot,' dag-blad-et 'the day-leaf or journal.' Further, it is by adding the definite article as a suffix that the socalled definite declension of adjectives has attained its peculiar form, as Bopp has clearly shown. Latin superlative, nouissimus for example, Bopp divides as nouis-timus; but I hold the true division to be nouist-imus. Indeed generally it seems to me that the ordinal numerals, as δεκ-ατος, ενν-ατος, έβδ-ομος, dec-umus, sept-umus, and the forms derived from prepositions,  $\nu\pi$ -atos,  $\pi\rho\omega\tau$ os (=  $\pi\rho$ o-atos),  $\mu\epsilon\sigma$ -atos (from μεσος, which is probably akin to μετα), εσχ-ατος, imus (= in-imus), primus (= pro-imus), summus (= subThe three forms ποτ-ερο-, ut-ero-, wheth-er, I defend in a wholly different way. In these I hold the dental to be part of the root syllable, representing probably an original n, as does also the d of id, quid, and quod in Latin, and t of our it, that, what, for again I protest against the doctrine that in these letters we have a mere suffix of neuters. I cannot here pretend to do justice to a question which covers so wide a field. My arguments were given many years ago in a paper read before the Philological Society (Proc. iii. 56), and were subsequently more fully developed in a paper attached to my little book entitled 'Alphabet,' &c., where they occupy twenty-three pages. There are also some brief allusions to these papers in the last of these essays. I have here only room for the outline. My argument contends, in the first place, that the third-person pronouns, which for Latin are represented by hic, iste, ille, is, and qui, together with the two prepositions cis, uls, and their derivatives, as also the demonstrative enclitic ce, seen in hic, istic, illic, with their adverbs, and in sic, nunc, tunc, were in origin all of demonstrative power, or, in other words, accompanied the physical act of pointing to an object; secondly, that the root form of

these words appears to have been ken, the guttural of which is preserved in cis and ce, also in keives and in the modern Italian chi, questo, costi, quello, colui, while the final n also is frequently cropping up. The already quoted keivos, with its analogues the German jener and our yon, beyond, present it distinctly. Of the forms hinc, inde, ενθεν, hence, thence, whence, I shall have to speak again; and I have already referred (p. 70) to the occurrence of the phrase Is Locvs in an inscription, where the long i in the nominative seems to point to an old root in for the pronoun, as distinctly as in Greek the numeral eis and the preposition eis do to forms  $\epsilon \nu$ - and  $\epsilon \nu$ . In isto- the n has given place to an s, and that s has thrown out an excrescent t, while illo-, or olo- (cf. Virgil's olli and the old form aboloes for ab illis), or rather both illo and ollo together, point to a form iol as an older variety of the root; just as mag-is and min-us suggest an older suffix ius. But iol stands to our you much as the Latin sol to our sun; and indeed the Slavic languages have the older ono in preference to olo.

Then for the relative and interrogative the evidence is still stronger. I shall not here rely on the fact that in the Tatar languages ken is the ordinary form of the relative, as in Finn and Mongolian; while in the first of these it has also the by-form cu precisely as the Latin, although at the same time I am satisfied that the German School of Philology is wrong in denying to these languages all affinity with the Indo-European family. But the evidence at hand is enough. The existence of an initial guttural will not be disputed, although it has been lost for unde, ubi, uter, ut. Nor is it difficult to establish the claim of the

concluding nasal. In the Spanish quien it has been preserved, but more commonly it has passed into the allied m, and this to an extent but seldom noticed. First the Sanskrit has it in kim, a form which has much distressed some philologers. Dr. Guest (Proc. Phil. Soc. i. p. 287) claims whom as an old English nominative, and he also refers to such forms as Swed. nom. hwem, gen. hwem-s, Dan. nom. hvem, Fries. gen. waems, Du. gen. wiens. Then our pronoun he is represented in Old Norse for the m. by nom. han-n, acc. han-n, gen. han-s, dat. hon-um. So again our definite article the takes the two forms of den and en, and carries the n for both m. and f. into every oblique case of both numbers. Lastly, the enclitic ce, so familiar in hic (hici-ne), istic, illic, and their adverbs, as also in nunc (nunci-ne), tunc, sic, has in Umbrian the form cen in the abl. of eiso, eizu-c or eisu-cen (A. K. p. 135).

I cannot stop to discuss the rationale of the change of meanings by which a mere demonstrative became available for use as a relative or interrogative. The fact is what concerns us most, and no one will doubt that in Greek the so-called definite article was not unfrequently employed as a relative, as by Herodotus when he says,  $\theta vov\sigma \iota \tau \eta \Pi a \rho \theta e v \varphi \tau o v s \tau \epsilon \nu a v \eta \gamma o v s \alpha \iota \tau \sigma v a \lambda a \beta \omega \sigma \iota$ ; while the German der and our own that perform both duties, and the same is true of most branches of the Indo-European family.

But the question remains, What is the meaning and what the origin of the assumed root ken? As a preparation for this inquiry, I would meet the question by another, What word is best fitted to accompany the act of pointing to an object? and the answer can only be one, a word signifying 'look.' Now ken in Scotch

and Old English is a verb with this very meaning, and, as I show in a subsequent paper, this word is no way limited to our own island or to the Teutonic family. It is the root of our verb know (kon-ow), and so lies at the bottom of the Latin gnosco, the Greek  $\gamma\iota\gamma\nu\omega\sigma\kappa\omega$ , the Sanskrit jna, and indeed extends far beyond these limits, so as to include Chinese itself, for again I repeat my unwillingness to draw an absolute line of distinction between our Indo-European languages and those of the Tatar stock. I go back, then, to the forms  $\pi o\tau$ - $\epsilon po$ -, ut-ero-, wheth-er, and claim the  $\tau$  and th as representing the n of the root  $\kappa\epsilon\nu$ .

I conclude this paper by a matter for which this last inquiry was a necessary prelude, the just division of the adverbs signifying whence, as  $\pi \circ \theta \in \nu$ ,  $\epsilon \nu \theta \in \nu$ , οπισθεν, ουρανοθεν, inde, unde, hinc, illim and illinc, istim and istinc, caelitus, funditus, intus, &c., hence, thence, whence. I may observe in passing that the use of intus in Plautus in the sense of 'from within' is not to be denied. Now the power of the genitival suffix, viz. 'from,' is precisely that which belongs to all these words, and us (os) is a familiar form of the genitival suffix, although an older form was probably ius, as in cu-ius, nullius (= nullo-ius),  $\lambda$ 070-10(s). the preceding paper I gave evidence that en of Heinrich-en, Frier'n Barnet, and the Sanskrit sun-u'n-am, was but a variety of this. I might at the same time have pointed to the so-called adjectives lin-en, gold-en, as genitives in origin; as also to the in of ξυλ-ιν-ο-, crast-in-o-, Roma'n-o-, as having the same origin and the same power, and even (pace Germany) to the Finn, where for the consonant declension wieras 'a guest,' kirwes 'a hatchet,' caunis 'beautiful,' have for genitives wierah-an, kirweh-en, caunih-in, and the Lapp, where toli 'a stool,' has a gen. toli-n. But if this suffix exist in the adverbs above given, we must divide them as  $\pi \circ \theta - \epsilon \nu$ ,  $\epsilon \nu \theta - \epsilon \nu$ ,  $\sigma \pi \circ \theta - \epsilon \nu$ ,  $\sigma \nu \circ \theta - \epsilon \nu$ , caelit-us, fundit-us, int-us, where  $\theta$  of  $\pi \circ \theta - \epsilon \nu$  belongs to the root, as does the  $\tau$  of  $\pi \circ \tau - \epsilon \rho \circ - \epsilon$ , the  $\theta$  of  $\epsilon \nu \theta - \epsilon \nu$ ,  $o\pi\iota\sigma\theta$ - $\epsilon\nu$  is excrescent, that of  $o\nu\rho\alpha\nu\sigma\theta$ - $\epsilon\nu$  is a substitute for the χ of ουρανοχ-, while caelit-us stands for caelicus, and the t of int-us is again excrescent. As in  $o\pi\iota\sigma\theta$ - $\epsilon\nu$ , &c. the  $\nu$  is often dropped, leaving but  $o\pi\iota\sigma\theta\epsilon$ , so ind-e and und-e probably represent an older ind-us, und-us, for the loss of the s would be followed by a degradation of the vowel into ĕ, as in ipsus ipse, magis mage, scripserunt scripsere. Precisely on the same principle the short final of superně and inferně is to be explained, for these words denote 'from above,' 'from below,' so that they are to be regarded as representing lost adverbs supernus, infernus, and are not to be mixed up with ordinary adverbs in e as recte, in which the suffix has a very different power. Then as exinde, proinde, &c. are often cut down to exim or exin, &c., illinde, which analogy suggests, would lead to what is actually found, illim, and that, with the enclitic added, to illin-c. So also with hinc and istinc; and this view is confirmed by the co-existence of utrinde and utringue, or utringue. With us the genitival suffix, as in Latin, has a sibilant, so that the old forms henn-es, thenn-es, whenn-es, are but genitives of a stem henn, &c., and thus here too the n of the root reappears; and to confirm the assumption that  $\pi \circ \theta - \epsilon \nu$  and our wheth-er, oth-er have in the th a representative of an n, we also find in Old English the variety heth-en, for what is now written hence. I conclude then that in ind-e, und-e, as in  $\epsilon\nu\theta$ - $\epsilon\nu$ , the dental mute is excrescent, and the n a portion of the root.

A difficulty may suggest itself in the cases of the assumed *ill-inde*, *ist-inde*, in that *ill* and *ist* alone belong, on my own showing, to the root; but my defence is that in *ill-o-* and *ist-o-* we have reduplicate pronouns. In the Greek  $o\dot{v}$ - $\tau o$ -s this is commonly admitted. But the neuter forms *ill-ud* or *ill-ut*, *ist-ud* or *ist-ut*, suggest a similar reduplication for them; and this admitted a form *ill-ind-e* is no longer an anomaly.

Lastly, let me notice the fact that the word look is used whether we point to a near or to a remote object, so that we here have an explanation of the difficulty which may well have occurred to the reader,—I mean that I have been assigning a common origin to words so opposed in meaning as hic and ille, citra and ultra, this and that. Thus we have in Terence luciscit hoc iam (Hast. iii. 1, 1), 'it is getting light, look, already;' while, on the other hand, when Virgil (Aen. v. 457) says:—

'Praecipitemque Daren ardens agit aequore toto, Nunc dextra ingeminans ictus, nunc ille sinistra,'

we find an equally satisfactory exponent of ille if we translate the second line by the words:—

'Now with his right redoubling blows; now, look, look, with his left.'

This paper in a great measure grew out of a desire to deal with questions which presented themselves in the preceding paper 'On Excrescent Consonants,' and so may be regarded as a sort of supplement to it.

## XII.

## QVAERITVR.

THE SANSKRIT LANGUAGE AS THE BASIS OF LINGUISTIC SCIENCE; AND THE LABOURS OF THE GERMAN SCHOOL IN THAT FIELD—ARE THEY NOT OVER-VALUED?

## FIRST PART.

I HAD thought at one time of placing at the head of this paper 'Doubts of a Non-Sanskritist.' But on reflection it seemed desirable that the title should be more definite. If the words I have actually used be thought by any one to savour of national ill-will, I must give the assurance that nothing could be more remote from my purpose or from my feelings. Those who have to deal with the classical languages must be either blind or ungrateful if they fail to acknowledge the deepest obligations to the scholars of Germany. The editions of Greek and Latin authors that have appeared in England during the last halfcentury have not been numerous, but even of these a large proportion have been simply reprints of German works. Again, the Lexicons of the two languages that have issued from the English press during the same period are for the most part so thoroughly of German material, that it would have been more creditable if the title-pages had carried the words, 'Translated from the German of . . . . with some few changes

and additions.' Again, if we turn our thoughts to the opposite side of the English Channel, we find no great activity in the sphere of classical, especially Greek, literature; yet what progress is visible there is chiefly due to the energy of German, not French, scholarship, as witness the valuable collection of Greek authors that has proceeded from the press of Didot. Nay, the high and indisputable reputation that Germany has won in this field only renders the duty more imperative to watch lest failure or shortcomings on any side should be kept from notice owing to that very prestige. Further, I wish it to be observed that the term I have used is 'overvalued,' which is quite compatible with an admission of great value; and again, I put what I have said in the form, not of a proposition, but of a question. It is only when that question is answered in the affirmative, or when the arguments put forward in this paper remain unanswered, that the slightest damage can be done to the reputation of the philologers concerned. It would have been simply indecent, if the present writer had expressed his fears in the form of a direct proposition, conscious as he is that he comes to the inquiry wholly destitute of what may at first sight be deemed an essential requisite, a knowledge of the Sanskrit language. Nay, he cannot pretend even to that smattering which may be obtained by a three weeks' study of the language, and which has before now served to float a big book in the English market, a little sprinkling of the Devanagari character, and a judicious use of the hard words Vriddhi, Anuswara, &c., passing for profundity in the eyes of the uninitiated. Such little knowledge as I have is that only

which may be acquired in the perusal of grammars and glossaries, and works of like nature.

The question here naturally suggests itself, how it is that I have taken upon myself to enter into a contest for which I am confessedly so ill-equipped; and my answer is that I find the same suspicions which have found a way into my own mind entertained by many others, and those too gentlemen whose position as scholars gives great weight to their opinions, though, like myself, they are wholly wanting in the special qualification, a knowledge of Sanskrit. In every point of view then it seems desirable that the question should be raised. If our fears are illfounded, it is well that they should be removed, and the road more thoroughly cleared of all obstruction for the Sanskritist. If otherwise, it is surely good for the progress of philological science that the matter should be thoroughly sifted.

I do not propose to enter into the domain of Sanskrit history and chronology, a task for which I am wholly unfitted, especially as those who have the best qualifications admit that it is involved in the greatest obscurity; nor indeed could one expect easily to find materials for accurate investigation in such a literature as that of the Vêdas. The 'Mantras,' on the one hand, dealing for the most part with the devotional, and the 'Brâhmaṇas,' on the other, with the ceremonial and dogmatic, can scarcely be available for such a purpose. As to the Upanishads or the short appended treatises, I will be satisfied with a second-hand quotation from a work of a learned Hindú, that they 'contain some rude indications of philosophic thought, and, like the twinkling of the stars in a dark

night, may occasionally serve as guides in a history of Hindú philosophy. They do not however exhibit any great attempt at method, arrangement, classification, or argument. Even there the poetry predominates over the logic. Bold ideas abruptly strike your fancy, but you find no clue to the associations which called them forth in the author's mind, and search in vain for the reasons on which they are based. Sublime thoughts are not wanting, but they resemble sudden flashes, at which you may gaze for a moment, but are immediately after left in deeper darkness than ever. Nor are they free from those irregular flights of the imagination in which poets with vitiated tastes delight to indulge, setting at defiance all rules of decency and morality.' (Banergea, Westminster Review, new series, vol. xxii. p. 463.)

An argument for the antiquity of the Sanskrit language has recently been founded ('Lectures on the Science of Language,' by Prof. Max Müller, p. 204, third edition,) upon certain passages in the Book of Kings and the Book of Job, but it is an argument which, as it appears to me, withers to the touch. All rests upon the statement that four articles imported into Judea in the days of Solomon, viz. the ape, the peacock, ivory, and sandal-wood, are called in the Hebrew text by names foreign to that language, but indigenous in Sanskrit. But it is not an easy matter to prove that a word is indigenous in a language, and the Sanskrit-speaking race on their first entrance into the Indian peninsula (for they are allowed on all hands to have been immigrants), would naturally adopt the native—that is, non-Sanskrit—terms for those objects which are peculiar to the country, provided indeed they had not already adopted them in the previous intercourse of commerce. But, passing over this consideration, let us throw a glance at each of the four words on which this important superstructure has been erected. Koph, the Hebrew for 'ape,' is, we are told, 'without an etymology in the Semitic languages, but nearly identical in sound with the Sanskrit kapi.' It is of course implied here, though not said, that the Sanskrit does furnish a satisfactory etymology for its kapi. To supply the omission, I turn to Bopp's Glossary, and there find that kapi 'ape,' has for its root the Sansk. verb kamp'tremble,' so that, for some reason denied to us, the ape was conceived by the Indian mind as 'the trembler.' Then ivory has for one of its Hebrew names shen habbim, where, as shen means 'tooth,' habbim might well speak of the 'elephant,' and this, it is said, 'is most likely a corruption of the Sanskrit for elephant *ihha*, preceded by the Semitic article.' If, as I suppose is the fact, ihha be a misprint for ibha, the resemblance is even then limited to the consonant, and we have nothing offered in the way of proof that this name for the elephant is the original property of Sanskrit. Thirdly, tukhi-im, in Hebrew 'peacocks,' bears no doubt a tolerably close resemblance to the Malabar name togëi; and this 'in turn has been derived from the Sanskrit sikhin 'furnished with a crest.' Lastly, the Malabar and Sanskrit name for sandal-wood is valguka; and 'this valgu(ka), the Professor says, 'is clearly the name which Jewish and Phœnician merchants corrupted into algum, and which in Hebrew was still further changed into almuq.' I would submit that at any rate the

word 'clearly' is somewhat out of place in an etymon which involves four assumptions, the aphaeresis of v, the apocope of ka, a paragogic m, and the metathesis of gum to mug. Even if true, such derivations have scarcely strength enough to serve as the foundation of so large a theory.

But the same writer has elsewhere ('History of Ancient Sanskrit Literature,' p. 524), contended that the Vêdas have an antiquity far older than the knowledge of writing. 'The collection of the (Vaidic) hymns, and the immense mass of the Brâhmana literature, were preserved,' he says, 'by means of oral tradition only.' In another passage of the same work (p. 507) he tells us that 'before the time of Pânini, nay, even when he himself wrote (sic) his great work, writing for literary purposes was absolutely unknown.' To understand the full force of this proposition, to form an adequate idea of the extent to which the Professor would tax the mnemonic powers of the Brahmans, we must remember that Pânini, according to his own authority, was preceded by whole generations of grammarians. In his 'Lectures on Language' (p. 110) he says: 'Those valuable lists of words, irregular, or in any other way remarkable, the Ganas, supplied that solid basis on which successive generations of scholars erected the astounding structure

<sup>&</sup>lt;sup>1</sup> I leave this as I wrote it, but I subsequently found that Prof. Max Muller had borrowed the whole argument from Lassen's 'Indische Alterthumskunde,' vol. i. p. 538, &c., so that the setting alone was his own. It is true that he himself referred to this passage of Lassen; but his reference was so placed, that a reader might well suppose the argument about 'ivory' alone to have been drawn from Lassen.

that reached its perfection in the grammar of Pâṇini.' But if the structure be 'astounding,' and 'the perfection of a merely empirical analysis of language,' it seems not to be possessed of much that would be interesting to the mere European scholar, for the Professor concludes his panegyric with the words: 'Yet of the real nature and natural growth of language it teaches us nothing.'

As regards the Vêdas themselves, one can readily imagine that religious feeling and poetical feeling combined may do much to invigorate the powers of memory, while the mere rhythm of verse contributes to lighten the task; but intense indeed must have been the feeling of duty which could induce Brahmans to commit to memory, and there retain, a complete library of the driest grammarians.

The whole argument then carries with it, as it seems to me, its own refutation; and in truth the challenge implied in the words, 'I maintain that there is not a single word in Pânini's terminology which presupposes the existence of writing, has already received a twofold answer from my colleague, Professor Goldstücker ('Pânini, his place in Sanskrit Literature, 1861); first a self-refutation, quoted from the Oxford Professor's own words: 'This last word lipikara (a writer or engraver) is an important word, for it is the only word in the Sûtras of Pânini which can be legitimately adduced to prove that Pâṇini was acquainted with the art of writing; and as my colleague observes (p. 17): 'It is obviously immaterial whether another similar word be discoverable in his grammar or not; one word is clearly sufficient to establish the fact.' But he further produces from

Pâṇini's own work an abundant supply of terms which could have no meaning whatever when writing was unknown. Let me quote one more passage from the same work (p. 14): 'As, according to his (Max Müller's) view, Pâṇini lived in the middle of the fourth century B.C. (pp. 245, 301, ff.), it would follow that, according to him, India was not yet in possession of the most useful of arts at the time when Plato died and Aristotle flourished.'

I have entered into these details to show the unsatisfactory condition of the chronology of Sanskrit literature, and at the same time I would suggest the question whether there should not be a little more caution in the acceptance of literary conclusions, even from those to whom the English public has been accustomed to look as authorities above all controversy.

But if we cannot have the advantage of a reliance on literary history, we must be content to examine the internal evidence supplied by the language itself, and the dealings therewith alike of Indian and European authorities. As my own doubts, and I believe those of the friends to whom I have already alluded, were first raised by what appeared to us as most strange, though generally sanctioned, etymologies, I will proceed to produce some of these, limiting myself for the most part to a single class.

Already Max Müller ('Lectures on the Science of Language,' p. 370) himself quotes, as an example of Indian etymology, the derivation of the sb. kåka 'crow,' from apakålayitavya, i.e. 'a bird that is to be driven away,' but adds that Yåska, another grammarian, anterior to Pånini, considered kåka to be an imitation of the bird's note. Whether the Professor

himself adopts or rejects this mimetic origin of kâka, his words do not enable one to say. But be this as it may, in another Sanskrit noun, kârava, Lat. cor(o)vo-, 'raven,' he steadily refuses to see what, for one, I must regard as a still more exact imitation of the bird's note, viz. cor cor. Had he included in his view the Greek κορ-ακ-,1 he might perhaps have assented to Pott's doctrine (E. F. ii. 506, 507), that are in Greek substantives is a suffix of diminutival power, so that κορ alone would be the root. He himself, in his aversion to what he calls by way of disparagement the Bow-wow theory, strives to deduce the whole family, kârava, κορωνη, raven, &c. from the Sanskrit verb ru, to which he ascribes 'a general predicative power' as expressing sound, 'from the harshest to the softest,' and so applicable 'to the nightingale as well as to the raven, nay, even to 'the barking of dogs' and 'the mooing of cows.' In a note however he hesitates between this etymon and one from the Sansk. kâru 'singer.' To the special honour of this last derivation, the raven seems to be about as well entitled as the parrot or the peacock; and the deduction of kârava from ru, a general term implying 'sound,' would probably be regarded by lawyers as 'void for uncertainty.'

The same objection of excessive generality applies to the whole class of etyma with which I now propose to deal, viz. those of words ascribed to roots of various forms, but with the one meaning 'to go.' Thus the

<sup>&</sup>lt;sup>1</sup> We must not suppose the ancients in their nomenclature to have distinguished with modern accuracy between the raven, the rook, and the crow. (See Mr. Wedgwood's paper on that subject.)

S. go (gav), the equivalent in power and probably in form of Lat. bov-, Gr. Bov-, as also of our own cow, is deduced by Sanskritists of all classes, Indian and European, from a S. vb. ga 'go;' and that this explanation of the word may not suffer for want of company, I may add the S. ila 'cow,' referred by Bopp (Gloss. 1 s. v.) to the vb. il 'go.' Now that animals like the 'hare' or 'stag' should receive a name from their marked power of locomotion is, at any rate on the logical side, admissible, and thus we may perhaps be ready to assent to the current etymologies of hare (Germ. hase), the Latin lepos-, and the Greek ελαφο. But the cow is scarcely entitled to put in a claim for such distinctions as against any other living creature. Strangely enough the same pair of words, go and ila, also signify 'earth,' and these again have the same origin ascribed to them (Bopp, Gl. s. vv.). So also the Gr. yaia passes with Bopp (V. G. § 123) as standing for yaFia, and so an adjectival offspring of a sb. corresponding to the S. go 'earth,' and eventually of such a vb. as ga 'go.' In the same section S. gmå 'a name for the earth in the Vêdadialect,' is deduced from the S. vb. qam 'go.' Nay, our own earth, though it comes immediately from our old English vb. ear 'plough,' represented in Sanskrit by ar, is traced ultimately to the S. r 'go' (Bopp, ibid., M. Müller, 'Lectures on Language,' p. 256, and Pott, E. F. i. 218). It would be an interesting fact if such a series of at any rate consistent etymologies

<sup>&</sup>lt;sup>1</sup> I have preferred to draw from this work, although now somewhat out of date and superseded by other works, simply because it comes from the founder of the science.

could be accepted as proofs that the Hindú mind had already discovered the motion of the earth, whether about its own axis or about the sun. But as it seems more probable that then, as now, there existed an inveterate tendency to treat the earth as the one fixed object to which all the movements around us are conveniently referred, we must look for some other explanation of the theory; and accordingly Bopp suggests that the movement of the earth must here be regarded as only 'passive,'-in other words, the earth (erde) is 'the betrodden one' ('die betretene'). Though it does not visibly move itself, man and beast would be in an awkward predicament for locomotion if there were no earth to move upon. Before leaving the earth, I ought to notice that Prof. M. Müller believes (p. 257) our word aroma to be another ramification of ar 'plough' and r 'go,' for does not Jacob say (Gen. xxvii. 28), 'The smell of my son is as the smell of a field which the Lord has blessed'?

From land I pass to water, but the same etymology pursues us. Thus the Ganges itself is the Sanskrit Gangá, literally the 'Go Go' (M. Müller, ibid. p. 384). So we have S. salila 'water' from S. vb. sal 'go' (Bopp, Gloss. s. v.); S. ap 'water,' the analogue of the Lat. aqu-a, from vb. ap 'go;' sarit 'river,' from vb. sr 'go' (M. M. ibid. p. 253); and saras 'water,' from the same vb. (ibid.). The last noun is by Bopp translated by the Lat. lacus, and declared to be one with the Greek έλος (cr. form έλεσ-) 'a marsh,' in which case the motion of 'going' seems to disappear. Yet after all Sanskritists may contend that marshland, being half water, half land, has a double claim to a derivation from roots which denote 'going.'

Take next the class of worms and reptiles. for example (V. G. § 86, 1), refers the Latin vermi-(= quermi-) and S. krimi to the S. vb. kram 'go;' the Germ. schlange 'snake' to S. vb. śrang 'go;' and the Lat. serpens, S. sarpa, first to S. vb. srp 'go,' and ultimately to sr 'go.' Had any of these verbs meant 'go by little and little,' the derivation would have been satisfactory, but the meanings given by Bopp in his Glossary to these verbs, as well as to all their compounds, furnish no authority for such an assumption. No doubt in his comparison of the verb srp with kindred languages he dwells much on the idea of slow movement in those kindred languages; and again Pro. fessor Wilson in his Grammar, though he adds the meanings 'creep or glide,' gives precedence to the general term 'to go.' I cannot but think however that the suffix of srp as compared to sr and that of the Lat. ser(e)p- with the varieties of  $\epsilon \rho(\epsilon)\pi$ - and Lat. r-ep- $(r\bar{e}pere)$ , Eng. c(e)r-ep (crep-t, creep), Germ. kr-iech-en, and with an additional suffix of diminution cr-aw-l, represents the idea paulatim, as it seems to do in the Lat. car-p- (see my paper 'On the Suffix agh,' &c. Trans. for 1856, p. 336). When I wrote what is there seen, I expressly stated that I was at a loss for the root ser- 'go.' This I now find in the S. sr, although I still believe a form ker, as heard in cr-eep and kr-iech-en, to be more genuine than sr with the sibilant. I am not deterred from regarding the two roots as substantially one by the fact that as a rule the guttural k or c of Western Europe is usually represented by the palatal s of Sanskrit, not by that which occurs in sr and srp.

Another class of words, which Bopp is disposed

generally to refer to roots significant of simple movement, are those which denote 'time' ('da überhaupt die Zeitbenennungen meistens von Wurzeln der Bewegung stammen, V. G. § 69). For instance our word year, old Germ. jâr, together with what he regards as an equivalent in form, the Gr. ώρα 'season,' is referred by him to the S. vb. ya 'go,' but by Lassen and Burnouf it seems to S. vb. îr 'go.' Again the Goth. aivs (crude form aiva) as also its relatives, Lat. aeuum, Gr. αιων, is deduced by Bopp, Graff, and Kuhn from S. vb. i 'go' (ibid.). The i might perhaps not have passed with the ill-informed as forming the kernel of these words; but all is accounted for: the initial a, it seems, attains its position through 'Guna,' and all that follows the i (or e) is to be regarded as a suffix. In spite of such a combination of authority I am still disposed to prefer my own etymology of aeuum from the Latin auge- (for the vowel-change compare the variety seen in the allied aεξ-ω and aυξ-αν-ω), with 'growth' for the original sense, as exhibited in the well-known line, Crescit occulto uelut arbor aeuo, 'grows like a tree with growth concealed.' The Lat. saeculum is also referred by Bopp (V. G. § 248, Anm.) to a S. vb. sac or sak 'go, follow.' Further, as he (Gloss. s. v. and V. G. ib.) considers S. amati 'time' a derivative from am 'go,' so he is also inclined to deduce from the same stem the Latin annus (as standing for annus) as well as the Greek evos. That amnus was in fact the older form of annus is proved by the derived sol-emni-s,. but to the derivation from a verb 'to go' I would oppose that other derivation which connects it with the Latin prep. am 'round,' German um. The very idea of a year implies a circle, and the words annulus

'a ring,' and the noun  $\bar{a}nus$  with a long vowel, seem to complete the proof. On the same principle the word year itself, like yar-d 'an enclosure,' and gar-d-en, &c., claims kindred with many words denoting a circle, as  $\chi_{0\rho\tau 0}$ -, horto-,  $\chi_{0\rho-0}$ -, cor-o-na-, circ-o-. The initial change between a Gr.  $\chi$ , Lat. h, and a g(y) in German and English is in accordance with the usual law, as seen in  $\chi_{\theta es}$ , heri, hesterno-, gestern, yesterday.

So much for the alleged deduction of substantives from Sanskrit verbs signifying 'to go.' But in the formation of secondary verbs also the roots i 'go,' and  $y\hat{a}$  'go' are thought by Bopp well fitted to play important parts, as for example in furnishing suffixes by which verbs are converted into passives (§ 739) and causals (§ 740). As regards the former, if körá yái, to take Bopp's own example from the Bengalî, have for a literal translation 'I am made' ('ich werde gemacht'), as given by himself, then gemacht is by itself already a passive, just as verloren is in the Modern German gehen verloren, literally 'to go lost.' We too may say 'become detested' or 'become fascinating,' where the distinction between the passive and the active idea turns upon the accompanying participle, not upon the word 'become.' Again, Bopp's illustration from the Latin amatum iri is surely not applicable. If the principle for which he is contending be valid, we ought already to have a passive in the indicatival phrase amatum eo 'I am going to love,' but this is a mere future of the active. The introduction of a passive of eo, whether in the indicative as amatum itur, or in the infinitive as amatum iri, is only a convenient mode of exhibiting an impersonal verb, equivalent to the French on va aimer. The examples of ueneo and

pereo, quoted by Bopp, are at first sight more to the purpose, and he would have done well to strengthen his case by comparing them with uendo and perdo. Yet after all uēnire, standing for uenum ire, means probably 'to go into the window,' and so 'be exhibited for sale,' which certainly is more truly the meaning of the phrase than 'to be sold.' So also uenui est admits of the literal translation 'it is in the window,' i.e. 'is offered for sale.' Again, perire 'to come to an end,' like the English go to the dogs or the Greek eppe es κορακας, contains no doubt what is virtually a passive idea: but this arises from the combination with the per and the es kopakas, &c. That 'go' does not carry in itself the idea of a passive is clear from our own phrases 'go to the Bar,' or 'into the Church,' or 'into business.' Curtius (Beiträge, p. 329) goes still farther, and conjectures that the  $\theta_{\eta}$  which appears in the aorist and future of Greek passives is connected with the S. vb. yû 'go,' in which however all resemblance seems limited to the long vowel. I pass then from the passive.

The causal mood of the Sanskrit verb, as well as the tenth conjugation in general, having for their distinguishing character the syllable ay, Bopp's mind is divided by a doubt whether this suffix should be referred to the verb i 'go' or i 'wish.' The latter one would think is far better fitted for the formation of a desiderative mood, which, it seems, is a general appendage to the Sanskrit verb. Nor does i 'go' at first sight appear a satisfactory element for the purpose of

<sup>&</sup>lt;sup>1</sup> Of causals some make ay the suffix, some ya. I believe the former to be right.

constituting a causal verb; but we are assured by Bopp (§ 740) that several Sanskrit words which denote 'motion' at the same time denote 'making.' Whether the particular verb i has this convenient privilege he does not stop to tell us. Assuming however that it has, we have before us a strange combination, that roots expressive of 'going' are alike fitted to form passives and to form actives.

But further, although the causative idea is declared to be the character of the tenth conjugation, I find little proof of this in the list of fifty-seven verbs quoted by Professor Wilson in his Grammar, for of all these at the utmost one in five can be explained as containing the idea 'to make.' Thus the first ten in the series are translated by the English verbs 'steal, disrespect, hurt, send, wink, speak, play, be feeble, be able, sound.' I am not then surprised to find in § 772 such a sentence as, 'It deserves however notice that in Sanskrit denominative verbs in  $ya^1$  occasionally avail themselves of the causal form without any causal meaning.' My own feeling is that the original notion paulatim resides in ay, and that it is the Sanskrit variety of that suffix which I have discussed at length in my paper on agh or ag, the passage of a g between vowels (ayâmi) into a y being a common occurrence. On this theory the meaning may well pass into that of frequentative or continuous. But leaving this question open, if we accept that one of Bopp's two explanations which finds in the suffix of the so-called Sanskrit causals or tenth conjugation the root i 'go,' we shall have to assign to this use of the word a

<sup>&</sup>lt;sup>1</sup> See note on the preceding page.

somewhat vast domain in the classical and German languages, for Bopp connects with the same type all the vowel-verbs of the Latin, at any rate the first, second, and fourth conjugations of that language (§ 745 c.); all the Greek verbs in εω, αω, οω, αζω, ιζω (§§ 109 a. b. 749, and 762), together with the particular verbs βαλλω, στελλω, ιαλλω, and ίημι; and lastly all the weak verbs of the German stock (§ 109). few of these verbs specially noticed by Bopp himself may claim a few words. We are assured that the Latin facio = S. bâv-áyâmi, literally 'I make to be;' iacio = yâp-âyâmi 'I make to go;' doceo = gnâp-âyâmi 'I make to know;' rapio = râp-âyâmi 'I make to give' (§ 747). It seems somewhat damaging to this theory that the suffixes i or e of the Latin, which Bopp himself holds to be the representatives of the S. ay, contribute but little to the formation of the causative idea, seeing that fac-, iac-, doc-, rap- in themselves already express the full notion of 'making, throwing, teaching, robbing;' as may be seen in the forms fac-ere, iac-ere, rap-ere, and in fac-tus, iac-tus, doc-tus, rap-tus. Yû-p-áyâmi is thought to possess a second suffix of causation in its p, so that  $y\hat{a}$  'go' is the real base of the verb; and if this case be doubtful, a causal p is declared with greater certainty to be an element in  $g\hat{n}\hat{a}$ -p- $\hat{a}y\hat{a}mi$  'I make to know,'  $g\hat{n}\hat{a}$  (or in English characters  $jn\hat{a}$ ) being what Bopp is pleased to call a root-verb, the equivalent of our know. of this jnd more hereafter. To place Bopp's doctrine clearly before me, I throw aside the equivalent portions eo and ayami, and there results the equation. Lat.  $d\breve{o}c = S$ .  $jn\mathring{a}p$ . No doubt the palatal j of the Sanskrit is with reason assumed to be a corruption of a medial guttural g or  $\gamma$ . The business then is to prove that  $d\breve{o}c$  is equal to  $gn\hat{a}p$ . I make no difficulty about the final consonants, for a Lat. c habitually corresponds to a S. p. But there still remain three problems for solution,—to identify the d with g, the short o with the long a, and to account for the appearance of n in the Sanskrit or its disappearance from the Latin. the first Bopp simply quotes the instance  $\Delta \eta - \mu \eta \tau \eta \rho =$  $\Gamma_{\eta}$ - $\mu_{\eta\tau\eta\rho}$ ; on the difference of vowel he says nothing. The difficulty as to the nasal is disposed of by the assurance that for  $q\hat{n}\hat{a}$ - $n\hat{a}$ -mi 'I know' there occurs an actual  $\hat{g}\hat{a}$ - $n\hat{a}$ -mi, and that in Persian there exists the form dâ-ne-m 'I know.' But surely the asserted loss of an *n* from  $gn\hat{a}-n\hat{a}-mi$ , when followed so closely by a second n, is but a poor justification for the disappearance of an n in doc for dnoc. For one then I must regard the doc of doceo as better explained within the limits of the classical languages by dec of deico (=  $d\bar{\imath}co$ ) and  $\delta\epsilon\iota\kappa$ - $\nu\nu\mu\iota$ , by  $\delta a\kappa$ , the root of  $\delta\iota$ - $\delta a\sigma\kappa\omega$ ,  $\delta\iota$ δακτος, and δακτυλος, by the dic of di-dic-i and dig of But if I must look to the Sanskrit, here too dig-itus. I find a thoroughly admissible representative in the vb. diś 'show,' with that palatal s which regularly corresponds to a western k-sound; and indeed Bopp himself I find, in his 'Glossary,' regards this root dis as one with the root of δεικνυμι and the Lat. dico.1

<sup>&</sup>lt;sup>1</sup> As some friends well acquainted with Sanskrit were slow to believe that a writer like Bopp could have published such 'extravagancies,' I quote his very words (§ 747): 'Kan ich aber das c der genannten Form (facio) nicht mit dem skr. causalen p. vermitteln, so glaube ich doch dem Lateinischen noch ein anderes Causale nachweisen zu können, worin c die Stelle eines skr. p vertritt, nämlich doceo, welches ich im Sinne von ich mache wissen auffasse und für verwandt mit di-sco (eigentlich ich wünsche zu wissen)

The p of rap- or rapi-, as also that of the S. rap- ayami, is again treated by Bopp as of causal power, and he finds in his root ra 'give' only a variety of da 'give.' Thus 'to give' and 'to cause to give or rob' owe their marked difference of meaning to the causal suffix; not that this is an essential matter with him, for this same root da or ra is thought by him to be identical with the S. vb. la, to which simple form is ascribed the double meaning of 'to give' and 'to take,' a mixture of ideas which, if carried out in life, might lead to inconvenient results.<sup>1</sup>

So much for the value to the Sanskritist of his roots signifying 'to go' in the way of etymology; and the stock is no small one. Taking of the ten conjugations the first alone, and again limiting myself to the series which Professor Wilson quotes in his Grammar as 'the most useful verbs of this conjugation,' I find just twenty, viz. 1. aj 'to go;' 2. at 'to go;' 3. i 'to go;' 4. du 'to go;' 5. ukh 'to go;' 6. r 'to go,' 'to gain;' 7. rj 'to be straight' or 'honest,' 'to gain,' 'to go,' 'to live;' 8. kram 'to go,' 'to walk;' 9. gam 'to go;' 13. vichehh 'to go;' 11. char 'to go;' 12. dhauk 'to go;' 13. pat

und dem gr.  $\delta\delta\acute{a}\eta\nu$ ,  $\delta\imath\delta\acute{a}\sigma\kappa\omega$  halte. Ist das d dieser Formen aus g entstanden (vgl.  $\Delta\eta\mu\acute{\eta}\tau\eta\rho$  aus  $\Gamma\eta\mu\acute{\eta}\tau\eta\rho$ ), so führt doceo zum skr.  $\acute{g}n\acute{a}p-\acute{a}y\acute{a}mi$ , ich mache wissen  $\acute{g}\acute{a}$ - $n\acute{a}$ -mi ich weiss für  $\acute{g}n\acute{a}$ - $n\acute{a}$ -mi) und zmu pers.  $d\acute{a}$ -ne-m ich weiss. Als ein Beispiel eines lat. Causale, worin das ursprüngliche p unverändert geblieben wäre, erwiese sich rapio, im Fall es dem skr.  $r\acute{a}p\acute{a}y\acute{a}mi$  ich mache geben entspricht, von der Wz.  $r\acute{a}$  geben, die, wie mir schient, nichts anders als eine Schwächung von  $d\acute{a}$  ist. Auch kommt, sowie neben  $d\acute{a}$  eine erweiterte Form  $d\acute{a}s$  besteht, neben  $r\acute{a}$  im Vêda-Dialekt  $r\acute{a}s$  vor. Mit  $r\acute{a}$  und  $d\acute{a}$  scheint auch ihrem Ursprunge nach die Wz.  $l\acute{a}$  identisch, welcher die Bedeutungen geben und nehmen zugeschrieben werden.'

<sup>&</sup>lt;sup>1</sup> Ibid.

'to go,' 'to fall;' 14. sad 'to wither' or 'decay,' 'to go' (with this appended: When the verb means 'to go.' the causal retains the final,—sâdayati 'he causes to go,' or 'drives'); 15. sad 'to decay,' 'to be sad,' 'to go;' 16. sasj 'to go;' 17. sidh 'to go;' 18. sr 'to go;' 19. srp 'to go,' 'to creep' or 'glide ;' 20. skand 'to go' or 'approach.' I should have made some addition to this list had I included those verbs which only express a more special or limited form of motion, as 'pervade,

jump, hasten, run, gallop, approach, wander.'

With such an abundance of verbs to draw from, a philologer should the more hold himself bound to proceed with caution, and so take care that the logical connexion between the root and the supposed derivative should be well-marked. Whether the examples I have quoted exhibit such caution, I leave to others to decide. Lastly, I think it right to repeat that, by confining myself almost wholly to those instances of bold etymology which deal with verbs signifying 'to go,' I avoid the charge of selecting instances favourable to my view. Indeed without some such limitation it would be an easy matter to pick holes in any of the most carefully elaborated philological works, for the most cautious etymologer is apt to be carried away at times by tempting theories. In the next section of my paper I purpose more particularly to consider Bopp's celebrated work, the 'Vergleichende Grammatik,' in its general system.

In the short discussion which followed the reading of the above paper at the Philological Society it was replied on one side that the idea of 'to go' was precisely that which was well adapted to denote an active verb. To this I answer that a vb. 'to go' was equally claimed for the special formation of passives; but in truth the argument seems to me upset by its very generality. What is fitted to denote every form of action is for that reason unfitted to denote any form of action. The very essence of language is distinction or difference. Accordingly the other answer to the difficulties I had raised was that although simple 'going' is commonly assigned as the meaning of the verbs I have quoted, yet in truth each of them originally denoted some special form of going. Such seems to be the feeling of Bopp also (V. G. § 515). I will only reply to this that I took the verbs with the meaning attached to them by the several authorities from whom I was quoting. But over and above this, when the discussion was brought to the individual substantives, I found that the Sanskrit scholars who were present employed in the defence of the Indian etymologies a vagueness as complete as that expressed in the general term 'going.' Thus go and ild 'the cow,' and go and ild 'the earth,' were said to be well entitled to such derivation, as being in the Indian mind the centres of activity most important to man.

I take the opportunity of making a slight addition to the paper. As sr, according to Wilson's Grammar (p. 200), at times signifies 'to go quickly' or 'run,' I am the more justified in attributing to the suffixed p of srp the power of paulatim. At any rate it has no causal power here. Further, if the Sanskrit vocabulary could deduce from a verb signifying 'to run' by the addition of this suffix a secondary verb srp 'to creep,' I am justified in connecting our own cr-ep

(whence creep and crep-t), as regards its root, with the base of the Dorsetshire hir-n = Ang.-Sax. yrn-an 'to run;' and that base, hir, corresponds of course to the Lat. cur- of curro. Again, if the S. verb sal 'go' is one with the verb sr 'go,' we have the analogue of this sal in the Greek άλλομαι and Latin salio, whence sal tu-s 'a sheep or cattle run.' I am the more inclined to attach some value to this conjecture, because as fal of fallere 'to cause to fall' seems to furnish the only 1 root for fors fortis, so does sal- for sors sortis 'that which leaps from the urn' (situla), a noun from which has come the verb sortiri of the Latin and the verb sortir (with a very different power, more akin to the original root) of the French. Lastly, let me observe that if the Sanskritists had been contented to derive sarit 'a river' from a root sr 'go' or rather 'run,' there could have been little objection, our own terms 'current' and 'watercourse,' Bull's 'Run' and 'runlet,' exhibiting a similar origin. Such terms as saras 'marsh or marshland' and ap 'water' have not the same justification.

<sup>&</sup>lt;sup>1</sup> I have been somewhat hasty in using the word 'only,' for I find Mommsen (Inscr. p. 268) writing: 'Recte omnino sortem derivarunt grammatici quidam a serie et serendo, ut fors venit a ferendo.' But I still adhere to what is stated above.

## XIII.

## QVAERITVR.

SECOND PART.

It would be to shrink from the task I have undertaken were I not to take into special consideration the great work of Bopp, who appears with something like general consent to be entitled the founder of Comparative Grammar as a science; and the claim upon my attention is only the stronger that his 'Vergleichende Grammatik,' the first portion of which was published in 1833, has been recently reprinted with some changes and considerable additions (1857–60).

Here, as in what I have already said, I shall without further apology for my temerity proceed to state unreservedly the objections that have presented themselves to my mind, not expecting those objections to be accepted as valid, but desirous that they may attract the notice of scholars whose more intimate acquaintance with the subject will enable them to detect any errors I may have committed. The contest is happily one in which the victorious and the defeated must alike be gainers, the one object of both parties being to promote the cultivation of the science of language.

First of all then I find in the very title of the commencing chapter ('Schrift- und Laut-System') what appears to me unphilosophical, viz. the precedence given to writing over sound. Over a large portion of our globe there exist whole races possessed of the faculty of speech, but without any knowledge of written symbols; and indeed no small part of the population even of this country is in this position. But I should have passed over this matter if the error, so to call it, had not told unfavourably on the arguments that follow. The very first paragraph in the chapter gives to three of the vowels a special character, which, as it appears to me, is not due to them. Thus the title of original vowels (Urvocale) is assigned to a, i, u; and this, I believe, on no other ground than that the Sanskrit alphabet had special characters for these when the sounds of e and o may have been denoted by combinations of the first three, much as the French language employs its dipthongs ai and au as simple vowels. Had the school of philology founded by Bopp looked upon the materials for oral language as belonging to the domain of physical science, and wholly independent of those other forms of language which are addressed to the eye, such an error could not have occurred. In particular I must repeat the regret, to which I had already given expression in the year 1852, when I drew up the present paper (Proceedings, vol. v. p. 192), that the valuable paper on vowel-sounds which was read by Professor Willis before the Cambridge Philosophical Society (November 28, 1828, and March 16, 1829) seems to have been wholly unnoticed by the leading scholars of Germany. At any rate, when I entered upon the present inquiry, I had never<sup>1</sup>

<sup>&</sup>lt;sup>1</sup> I subsequently found that I had not done justice to German scholars in this remark. In Dr. Bindseil's 'Abhandlungen zur allgemeinen vergleichenden Sprachlehre' (Hamburg, 1838), p. 84, reference is made to Professor Willis's paper, and from the appended

come across the slightest allusion to this paper, or to the principles established in it, in any German writer; yet had read much from this quarter that would never have been written by any one acquainted with the results of Mr. Willis's experiments. Nay, I do not recollect to have seen at that time in any of their prominent works in the field of philology any reference to that physiological organ which may literally be called the primum mobile of human speech,—I mean the two chordae vocales. Now that Professor Czermak of Prague by his simple apparatus has enabled the inquirer to witness the action of these musical strings in the living man, we may hope that the study of oral language may be placed on its proper basis. It will then be laid down as the first dogma that as vowelsounds constitute the substance of language (for brevity I drop the word 'oral,' which is the only form here under consideration), so the character of any vowel depends almost wholly on the distance for the time between the chordae vocales and the margin of the lips,—in other words, on the length of the vocal pipe, the position of the tongue being of no moment so long as it does not close the passage of air. So thoroughly definite and mathematical is the character of the physical experiments on which Professor Willis's results are founded, that he has given numerical values

note I learn that the paper itself was reproduced in the German language in Poggendorff's 'Annalen der Physik und Chemie.' Still Dr. Bindseil himself seems to have been satisfied with a bare reference, making little or no use of the principle, nor does his work appear to have met with much notice among his countrymen. It stopped abruptly with the first volume, although this contains only a general introduction and a treatise on gender.

to the distances that belong to such of the vowels as are most familiar to English ears. At the same time as the number of points in a line is infinite, so the vowel-sounds pass by imperceptible gradations from the one extreme i (the sound in feet) to the other extreme u (or oo in boot). Thus it is wholly owing to the imperfection, yet necessary imperfection, of alphabets, that there is but a limited set of symbols for vowel-sound. The number itself is essentially infinite; and it was therefore a subject of amusement as well as regret to hear some few years ago that a conclave of learned philologers was then sitting in London to determine, among other high matters, what was the full number of vowels.

But the vowel-order i, e, a, o, u (with the sounds which prevail on the Continent), as resulting from Professor Willis's experiments, would have supplied the German philologers with a principle capable of solving pretty well all the problems that arise in connexion with the vowels, not merely of the Indo-European family, but of language in general. In the paper already referred to (Proc. Philolog. Soc. vol. v. pp. 191—204) I have shown in some detail that it explains the umlaut and rück-umlaut so-called of German philology, the formation of plurals in English, &c. by what Grimm calls 'motion,'—that is, an alteration of the root-vowel, as in geese from goose, and generally the assimilation of adjoining vowels so familiar in all the Tatar languages and prevalent \* to a considerable extent in the Keltic, Teutonic, and Classical languages, to say nothing of others. In page 203 of the paper I gave, from my colleague, Professor Malden, a tabular view, showing the full

development of the principle in the changes of Greek vowels and diphthongs. And I have little doubt that the mysterious Guna and Vriddhi of Sanskrit are simply results of the same law.

No doubt Bopp has allusions to the principle of vowel-assimilation, but these are altogether incidental. Thus it is only when he passes from the Sanskrit (§§ 41, 42) to deal with the Zend, that he notices some cases where the presence of a y, i, or e affects the vowel of an adjoining syllable, and in § 46 mention is made of a similar euphonic influence belonging to a Zendv (w). But these are matters which should not be treated as peculiarities of the Zend. The philologer is bound to state the law of vowel-assimilation in its broad simplicity.

But there is another point in which Sanskritists seem to have been misled by the habit of looking at language in its written aspect. They ascribe to the Sanskrit, in accordance no doubt with Indian authority, two vowels, r and lr, which at any rate do not present themselves in the vowel-series of the Cambridge Professor. Moreover it is admitted that this vowel r is closely related to the ordinary liquid r. May I propose as the probable solution of the whole difficulty the following ?—It is well known that the two liquids r and l often lead to the disappearance of an adjoining vowel; most persons would say to a metathesis of the vowel, a doctrine which I hold to arise from an inaccurate view of the matter, though this for the present is not important. Our own thorough for example appears in the two shapes through Eng. and durch Germ. Again, in our provinces the form brid is at times used, where the prevalent language prefers bird;

so pretty and perty coexist. The Latin too has trucand toru-o-, and the Greek opasos and oapsos, with but little distinction of meaning and no distinction of origin. In such cases it is convenient to have a notation which will readily adapt itself to the two varieties of pronunciation; and on this principle it would not have been unwise to employ such a form as brd, prty, to represent at once bird and brid, perty and pretty. The Slavic languages are not less given to such varieties than others; and accordingly words without any represented vowel occur in the Bohemian vocabulary, as krt 'mole,' krk 'neck,' blb 'blockhead,' wlk 'wolf.' Yet Dobrowsky does not on this account class r and l with the vowels of the language. Possibly the habit of virtually dropping the letters r and l, as in the case of bird in the mouth of a Londoner (böd), and talk, calm generally, as well as the Fr. meilleur, may have had its counterpart in India, and so have lent some encouragement to the doctrine that they are vowels.

But to return to the ordinary vowels: if a language is limited to three symbols for their representation, it is a matter of course that a should have a first preference, because, lying in the middle of the series, it is for that very reason the easiest to pronounce, and consequently the most common; and after a the vowels i and u have the next claim, as occupying the two extremities.

It has also been urged that the Sanskrit alphabet has a special claim to our consideration in its philosophic completeness. But this claim is open to grave doubt, seeing that it appears to have been without any character for the sound, if indeed it possessed the sound itself, that is heard in the initial consonants of our English thin and thine, fat, vat, in the two consonants of the Fr. juge and the final of the German einfach. On the other hand, it appears superfluously rich in its ten asperates, distributed through the so-called gutturals, palatals, cerebrals, dentals, and labials; that is, if our informants be right in pronouncing these asperates as we pronounce the italic consonants of blockhouse, loghouse, coachhouse, bridgehouse, carthouse, guardhouse, chophouse, clubhouse. If such be the correct pronunciation, the non-asperate character together with the simple h might surely have sufficed. I have also assumed that a (va of German Sanskritists) corresponded to an English w. But if it really be a v, then a w is wanting; if it be at one time a v, at another a w, then we have another defect in the alphabet, two uses of a single symbol. But these very difficulties about the pronunciation seem to be valid reasons why we should select our primary facts from the known sounds of living tongues, rather than draw from alphabets of ancient date, no matter how venerable, in which the problems of pronunciation must to a considerable extent be full of difficulty, if not insoluble.

The second main-heading in Bopp's work is 'On Roots' (Von den Wurzeln). As regards the preliminary discussion which treats of the distribution of languages into classes, I will confine myself to the remark, that as in the preceding chapter, so here again the author appears to have been led astray by the consideration of written language. No doubt the Chinese is to the eye monosyllabic. To the ear not so; for it is well known to those who have learnt to speak

the language in China itself, that it abounds in disyllabic and polysyllabic words, whose unity, as with us, is denoted by the possession of a single accent. Thus Bopp is simply wrong in his statement of facts about the Chinese language (§ 108, p. 201, note); and again his definition of the Semitic family as one having disyllabic roots is at variance with the doctrine, now maintained by many of the first Hebrew scholars, that these apparent roots are in truth secondary forms. And indeed the Hindostani furnishes an instructive parallel, for here too it seems the existing verbs cannot be reduced to forms of less than two syllables, until we pass from the limits of the Hindostani to the parent Sanskrit.

I must also point to another instance of error similarly caused. The peculiar notation employed for Hebrew words, in which symbols for consonants play the most important part, and the habit of denoting variations of meaning to a great extent by mere variation of vowels, as katul 'killed' with a fem. ktul-ah, and kotel 'killing' with a fem. kotl-ah (§ 107, p. 196), have together led Bopp and his followers to call the consonantal combination ktl the root of the verb in question, although this combination is for the ear an absolute nullity. Nor is he himself blind to this inference, for he expressly says: "A Semitic root is unpronounceable." As well might he, with the English words bind, band, bond, bound, bundle before him, set down as the root of this English verb the letters bnd.

But I pass to a graver matter, and one that affects' the whole texture of the book. The German philologer, departing from the course marked out by his Indian authorities, refuses to accept the doctrine that all words are traceable back to verbs. Accordingly he divides the roots of the Indo-European family into two classes. 'The main principle of Word-building in this class,' says he (§ 109 a, p. 203), 'appears to me to lie in the union of verbal and pronominal roots, which together constitute, as it were, the life and soul' (of the language). Poetical escapades of this kind naturally excite a suspicion of weakness in a theory. I propose then to examine this doctrine of pronominal roots in some detail. It is one that is also maintained by Prof. Max Müller in his 'Lectures on Language' (p. 272, &c.). His nomenclature indeed is slightly different from that of Bopp's. To 'verbal' he prefers the term 'predicative,' and instead of 'pronominal' he talks of 'demonstrative' roots; but substantially the two writers agree. As Prof. Max Müller is somewhat more definite than his fellow-countryman in his statement on this subject, I will quote a few lines from him. 'If they (our primitive ancestors),' says he, 'wanted to express here and there, who, what, this, that, thou, he, they would have found it impossible to find any predicative root that could be applied to this purpose.' And hence he says soon after: 'We must admit a small class of independent radicals, not predicative in the usual sense of the word, but simply pointing, simply expressive of existence under certain .... prescriptions.' I accept the challenge implied in the first of these paragraphs, or rather accepted it many years before it was given, for already, in 1847, in the 'Proceedings of the Philolog. Soc.' (vol. iii. p. 56) I put forward the theory that such a verb as our own 'ken' or 'look' as an imperative would supply what was wanted.

In the paper to which I refer the problem was considered in considerable detail, alike from the formal and logical points of view. Thus, as regards the mere shape of the words, I showed that pronouns of the third person exhibited an initial guttural in pretty well all the languages of Europe and Asia from the Atlantic to the Pacific, and from the Mediterranean to the Arctic Sea. On the other hand I produced similar evidence for the presence of a final nasal, and so accounted for the form of the Sanskrit kim which is set down as the 'dhâtu' of the relative, but by its final letter has been, I find, a stumbling-block to Sanskritists. In short, I considered that a syllable ken, or something like it, appeared to be the basis of pronominal words of the third person, including in that term demonstratives, relatives, and interrogatives, which I held to be of one stock. On the other hand I regard this basis of pronouns to be one with our English verb ken 'see.' But of course I could not rely on our English language alone, or even its German congeners. As ken, or if it be preferred con, is the simple root whence comes our derived verb k(e)n-ow or k(o)n-ow, in precise agreement with the verbs bell and bellow, so the root in question virtually exists in all those languages which possess a representative of know, as Latin with its gnosco, Greek with its  $\gamma_{i\gamma\nu\omega\sigma\kappa\omega}$ , and Sanskrit with its  $jn\hat{a}$ . Nay, the Latin itself has traces of the simpler verb gon. I refer first of all to the participles a-qn-itus, co-qn-itus, which come from stems a-gon-, co-gon-. From agnosc- and cognosc- we must have had agnōtus cognōtus. Secondly, cătus 'shrewd' seems to be a participle from a stem cen, just as in Greek we find words ending in  $\phi a \tau o s$  from  $\phi \epsilon \nu$ - 'kill.' Over and above this I pointed to the suffix ce of Latin demonstratives, as hic, istic, illic, sic, nunc, &c. and the so-called interjection en 'behold,' as exhibiting our root ken in two fragmentary varieties, much as a particle of totally different origin yet identical form, the Homeric  $\kappa \epsilon \nu$ , takes in Greek the several corrupted forms of κε or κα and αν. Further, as the range I claimed for the pronominal base ken extended to the Pacific, so I quoted from the Chinese itself a verb ken 'see.' But I failed to notice the simple verb in San-Let me now supply this omission by producing the reduplicate verb in mi, chi-ket-mi 'I see.' This verb Bopp himself identifies as regards root with the Sanskrit verb chit 'perceive, know,' and this again with the Zend chin (V. G. 109 b 2, Anm. p. 239), so that the change of ken to ket is no difficulty for Bopp; and I confirm this by the parallel case of the Latin pronominal form cit-ra, cit-ro, cit-erior, cit-imus. I am farther indebted to Bopp for a knowledge of three other analogues of my verb, quita or kita of the Philippines, the New Zealand kitea, and Malagash hita, words also signifying 'to see,' and identified by himself with the Sanskrit ket (§ 87 2). Again, the root in its purest form is found in the Keltic family, as in Cornish gon, and Old Irish gen 'know' (W. Stokes's edition of the Middle-Cornish poem 'The Passion,' notes, p. 94). Lastly, the Lithuanian has the particle kat 'see there.' Thus the area of the verb is as extensive as that of the pronoun. On the side of form then there remains nothing to desire; and as to meaning I would ask whether any idea could be in better keeping with pronominal demonstratives

than that of 'see,' 'look.' The very word 'demonstrative,' which Prof. Max Müller selects for his definition, suggests this interpretation; and he himself adds that their office is 'to point,' and so determine 'locality.' It would be more correct to say that it belongs to the finger to point and to the voice only to call attention to the finger's direction by uttering the word 'look.' It is with this feeling that the French has formed its voici and voilà, and of these the latter is often cut down in rapid pronunciation to v'là, an abbreviation which is in keeping with what has been seen in our assumed corruptions of ken. I have already pointed to Terence's luciscit hoc iam and Virgil's nunc dextra ingeminans ictus, nunc ille sinistra, as instances where the most graphic mode of translation is to treat the two demonstrative pronouns as practically the imperatives of a verb with the signification of 'look,' repeated if preferred, for both hic and ille when closely analysed turn out to be reduplicated forms. It may be observed too that our own lo is an example of a verb, look, cut down to what is little better than a particle. Nay, when we ourselves utter the word this or that, we do little more than invite the person addressed to direct his eye to some object at which we are pointing, so that in real power these words are equivalent to an imperative 'look.' No doubt the mind is not at once reconciled to the identification of a verb with an adjective, much less to the declension of a verb as though it were an adjective. Yet if the Latin ecce 'behold' is a verb, and few will venture to deny it, we have a perfect parallel in such phrases as eccum me, eccos uideo incedere patrem et magistrum, as used by

Plautus. For the full details of my argument I must of course refer to the paper itself. But whether my theory be right or wrong, I trust I have said enough to show that Prof. Max Müller's broad denial of the possibility of finding a suitable 'predicative' root is untenable.

On the other hand let us look at the general theory of roots, whether 'verbal' or 'pronominal,' as put forward by the German school. Bopp indeed puts aside for the most part the question of the origin of words, as not falling within the scope of his work, but Prof. Max Müller speaks somewhat more definitely on this subject. Yet his views, I think, will not be found satisfactory to others, and seem not altogether satisfactory to himself, for, after touching on the topic at the beginning of his book, he practically postpones the question to his last chapter, pp. 349-399, and even then he nearly reaches the end of the chapter before he comes to the point. It is only in page 391 that he says: 'And now I am afraid that I have but a few minutes left to explain the last question of all in our science—How can sound express thought? I find another reason for doubting whether he is a firm believer in his own theory. The said chapter begins with an admirable extract from a work of Dugald Stewart's which spurns with contempt 'that indolent philosophy which refers to a miracle whatever appearances, both in the material and moral worlds, it is unable to explain.' I say then that when Prof. Max Müller transcribed these words, he had not yet given a thoroughly cordial assent to the view of language with which the chapter ends; for he himself, in his distress, practically summons to his aid the deus ex

machina, first telling us (p. 392) that 'man in his primitive and perfect state possessed the faculty of giving expression to the rational conceptions of his mind,' and then adding that 'that faculty was an instinct, an instinct of the mind as irresistible as any other instinct.' Further in a note he says: 'The faculty peculiar to man in his primitive state, by which every impression from without received its vocal expression from within, must be accepted as an ultimate fact.' For myself, I can only look upon this last passage as a simple admission that he has no solution of the problem to offer, while the preceding assumption, that language is the result of instinct, seems to savour of that indolent philosophy which the Scotch philosopher is quoted to condemn. Again, the assertion that language first came into play when man was 'in his primitive and perfect state,' seems hardly consistent with the tone of the first lecture, in which he led his hearers to anticipate a very different conclusion. That lecture begins with a justification of the phrase 'Science of Language,' and then refers the origin of every one of our sciences to the agency of man, as stimulated by his 'wants,' when society was yet semi-barbarous or half-savage; and his argument further implies that all the sciences, including of course that of language, were things of gradual growth, beginning in what was humble and lowly. All this is surely at variance with his later theory, that 'the 400 or 500 roots' which are 'the constituent elements' of language are 'phonetic types produced by a power inherent in human nature, and exist, as Plato would say, by nature; though with Plato we should add that, when we say nature, we mean by the

hand of God.' One cannot but think that such explanations must have been intended for the class of people so well described by Prof. Max Müller himself (p. 364), those 'who prefer the unintelligible which they can admire to the intelligible which they can only understand.'

But before I pass from his Lectures, I take the opportunity of commenting on two other kindred matters. In p. 351, having said that 'man could not by his own power have acquired the faculty of speech, which is the distinctive character of mankind, unattained and unattainable by the mute creation,' he confirms his proposition by a reference to Wilhelm v. Humboldt's writings: 'Man is only man through language, but to invent language he must already have been man.' This is a taking argument, and one that would be thoroughly valid on the assumption that language must have been created, so to say, at one gush, like a metallic casting. But if we include in our view the possibility of a gradual and slow development of the faculty, such as Max Müller himself in his first chapter assigns to the creation of all the sciences, including by implication the science of language itself, the whole difficulty is dispelled. On this theory the human mind and the faculty of speech react each on the other, and thus 'the foundationstone of what was to be one of the most glorious structures of human ingenuity in ages to come may have been supplied by the pressing wants of a semibarbarous society' ('Lectures,' p. 5).

But there is another writer, and he not a German, who, as agreeing in one of the two phases of the Oxford Professor's book, claims our attention. In the

'Study of Words' (p. 16) there stands the sentence: 'God gave man language, because he could not be man without it.' This seems to imply that language was contemporary with man's creation. May I be permitted then to ask how this doctrine is to be reconciled with what I suppose will be allowed on all hands as a fact, that the primitive language must have been wholly wanting in terms for spiritual and metaphysical ideas, seeing that the roots of language in their first meaning are very generally held to have a special reference to the material world. Hence, if the said doctrine be well-grounded, at the very time that primitive man existed in the most perfect, the most spiritual condition, he was yet destitute, it would seem, of terms to correspond with all the sublimer elements of his mind. In saying that terms for spiritual ideas are generally traceable to a material origin, I have in view such cases as the derivation of anima 'soul' from an 'to blow,' of spirit from spirare 'to breathe,' and of ghost as connected with gust, with gas, with yeast ('Lectures on Language,' p. 387). But while I take these examples from Prof. Max Müller, I must demur to his derivation of soul, Gothic saivala, from saiv-s 'the sea,' and still more to his explanation that 'the soul was originally conceived by the Teutonic nations as a sea within heaving up and down with every breath, and reflecting heaven and earth on the mirror of the deep.' As I have said before, I am always alarmed when I find poetry doing duty for logic. Still, in reliance on more sober examples, I venture to affirm again that the late formation of spiritual language is more consistent with the theory of man's progressive improvement than

with the converse theory of his degradation,—in other words, more consistent with the first phasis of Prof. Max Müller's book than with the second.

The 'instinctive' origin of language, as laid down in the 'Lectures,' might to some minds have suggested the inference that language ought then to be the same for all people in all countries, and that every infant at the outset of its little life would have been possessed of useful speech; but a condition of things so much to be desired is sadly at variance with fact. This difficulty however the author of the theory at once meets by a little corollary to his theory, that 'man loses his instincts as he ceases to want them.' Yet in speaking of his 'demonstrative' roots (p. 272) he seems to imply that the instinctive movement still retains its force. 'The sound ta or sa,' says he, referring to the Sanskrit pronouns, 'for "this" or "there" is' (note the present tense) 'as involuntary, as natural, as independent an expression as any of the predicative roots.' It must be due to some unhappy idiosyncrasy, I suppose, that I myself feel not the slightest tendency to follow such an impulse, however natural, however involuntary it ought to be. If I want to say 'this,' I say this; if I want to say 'there,' I say there. I certainly do not say either sa or ta.

But, admitting for the nonce the new doctrine of pronominal or demonstrative roots, let us consider the purposes to which they are applied by Bopp and the Oxford Professor. In the instances I am about to quote from these two writers I wish special attention to be paid to the habitual, almost universal, assumption, that if the conditions of outward form be satisfied, it

is unnecessary to enter into any logical proof of the appropriatenesss of the idea. As the references on this head to Prof. M. Müller will be but few, those to Bopp numerous, it may be convenient to give precedence to the disciple over the master. In the index to the 'Lectures,' under the word declension, I find the proposition that 'most of the terminations of declension' are 'demonstrative roots.' Again, in the text (p. 274), we are told that 'the Latin word luc-s' is formed by 'the addition of the pronominal element s,' and signifies literally 'shining-there;' and he goes on to say that by adding 'other pronominal derivatives' we get 'lucidus, luculentus, lucerna, &c.' What these other pronominal elements are, or how they are fitted for the purpose, he deems it unnecessary to tell us. So in p. 221 he says that 'the short i of the Sanskrit locative hridi "in the heart" is a demonstrative root, and in all probability the same root which in Latin produced the preposition in. He goes on to deal with the formation of the genitive. dative, and accusative, but in a manner so misty to my comprehension that I fail to pick up a single idea, and can solely refer to his book, pp. 221-224.

Bopp starts (§ 105) with the doctrine that the class of roots he calls pronominal 'give origin to the pronouns, to original prepositions, to conjunctions, and particles.' In § 115 he advances a step farther, claiming 'the case-endings as, at any rate for the most part, of like origin.' Looking upon the nouns of language as the *Personae Dramatis* of the World of Speech, he holds that 'the original office of case-suffixes was to express the mutual relations between these "Personae" in respect of place;' and with this

feeling he asks 'What class of words could be better qualified to fulfil such an office, than those which at once express personality and the idea of place, whether nearer or more remote, whether on this side or on that?' Accordingly (in § 134, p. 277) the s of the nominative is referred to the pronoun sa 'he, this, that, fem. sd; (in § 156, p. 320) the m of accusative masc. and fem. to the compound pronouns i-ma 'this,' a-mu 'that;' and the final t which presents itself in the neut. nom. and acc. of certain pronouns, as tat and kat of the Vêda dialect, to the neut. pron. ta, Gr. το. Again, in § 158 the suffix d of the instrumental case is 'as he believes' but a lengthened variety of the pronoun a, and one with the prep.  $\hat{a}$  'to' (Germ. an), a meaning however which one might have thought would be more in place in the accusative. In § 164, p. 329, the datival & is said probably to belong to the demonstrative  $\hat{e}$ , which  $\hat{e}$  however is apparently only an extension of the stem a, —that is, the very pronoun which has already done duty for the instrumental. In  $\S$  179, t we are told is the characteristic of the ablative, and 'no one' (I quote his own words) 'who has once acknowledged the influence of prepositions on case-endings, can have any doubt in referring it to the demonstrative stem ta "this," which has already in the neut. nom. and acc. put on the nature of a case-symbol, and will presently be found supporting the character of a personal suffix in verbs;' so that Bopp seems to think that the fact of its employment in two duties is a reason for adding a third duty. Most people, I think, would have arrived at an opposite conclusion. In § 184, p. 378, and  $\S$  194, p. 393, the genitival suffix s is held to be

one with that of the nom., and so the same as sa 'this,' while the longer suffix sya of genitives is the Vaidic pron. sya,—that is, a compound of two pronouns, sa 'this,' and the relative ya. Lastly, the i of the locative he identifies, like Prof. M. Müller, with the demonstrative i.

I might be charged with a want of fairness to Bopp if I omitted to report an argument by which he defends his theory as regards the nominatival s in the masc. and fem. In the declension of the simple pronoun sa 'this,' he observes that it is only the nom. m. and f. that present the s, the neut. nom. and all the oblique cases having an initial t, just as in Greek we have  $\delta$ ,  $\eta$ , with a mere asperate, but afterwards  $\tau_0$ , του, της, του, &c., so that there is a peculiar fitness in the employment of this pronoun for the two forms for which he claims it. However, he subsequently damages his theory by admitting (§ 345) that originally the s may have been carried through all the cases and numbers, excepting only the neuters, and quotes the Vaidic locative sasmin for tasmin, and the old Latin sum, sam, &c., for eum, eam, &c. And even this persistence in excluding an s from the neuter is at variance with his own statement (ibid.) that the Greek σητες, σημερον, stand for σο-ετες, σο-ημερον, which  $\sigma_0$  he himself holds to be of the same stock with the Sansk. sa.

Thus for all the case-endings it is enough with our author to find some pronoun signifying 'this' or 'that' or 'what,' it matters little to him which, and to defend himself behind the position that case-endings are in their nature of a locative character. He fails to see that the pronouns in question are but pointers,

and define only position, and even then had no definite meaning in the outset of things, until aided by the pointing fingers. He himself indeed admits (§ 371, p. 180,) that the same pronoun originally signified 'this' or 'that,' 'nearer' or 'farther,' the mind supplying the necessary limitation. But while the demonstrative pronouns at most define only the 'here' or the 'there,' it is the special office of ease-endings to deal with motion as well as rest, to talk of the 'whence,' and the 'whither,' as well as the 'where.' Nay, if Bopp's system were valid, we might freely interchange all the case-endings.

But I have yet two other objections to offer, which seem each of them fatal to his doctrine. In the first place, the form he assigns to the case-endings is, in most instances, a very late and degraded form. example, the locative and dative, which I believe to have been of one origin, have assigned to them as suffixes nothing but the vowels  $\hat{e}$  and i respectively. But the Latin in i-bi, ali-bi, utru-bi, exhibits a b, and as the Greek habitually has  $\phi$  as the representative of a Latin b, there can be little doubt that the Homeric ουρανο-φι presents the suffix in a more accurate shape than the ordinary Sanskrit locative. There is still another letter to re-establish in its proper position, a final n; and Bopp himself admits that  $overavo\phi v$  is the older form whence ουρανοφι was derived. The Latin nobis, vobis, by their long vowel, also betray the loss of an n, and still more accurately defined is the suffix in the Old Prussian dat. pl. in man-s (§ 215, p. 424). Nay, I cannot but suspect that the Sanskrit, in its masc. loc. tas-min, has also in the last three letters a satisfactory equivalent for the  $\phi \iota \nu$  or bin, for,

on grounds independent of the present question (see Proceedings, iii. p. 66, note §, and iv. p. 30), I should claim tas, rather than ta, for the root-syllable of the pronoun, and this view is confirmed by several other cases of the pronoun. So too the Umbrian locative appears to have had a suffix men or mem (§ 200, p. 400), and the Zend for the dative of the first personal pronoun has  $mai-by\hat{a}$ , the long a of which would have a satisfactory explanation in the disappearance of a nasal. But, to take a more general survey of the question, I would object to the fragmentary manner in which the school of Bopp pursue the inquiry into the form of case-suffixes. Each case must originally have had a common form of its own, no matter to what declension a noun belonged, no matter what its gender; and again, it is easy to see in nearly every case that the plural and the so-called dual forms (which in fact are but varieties of plurals) contain, in addition to the case-suffix of the singular, a second suffix denoting plurality, either a nasal syllable, as in our ox-en, or a sibilant, as in our cow-s. Hence in our search for the full forms of case-suffixes we are entitled, and therefore bound, to include all the forms belonging to a given case without distinction of declension, or gender, or number.

Then again, on the other side, Bopp appears to be unhappy in his dealings with his so-called pronominal roots. These also he has robbed, as it seems to me, of a final n, which readily interchanged as well with the liquid m as with members of its own dental class, t and s. Thus for the first syllable of the Latin is-to-I find a more satisfactory explanation of the s than Bopp's own theory (§ 343) that it results from 'a petri-

faction' of the nominatival s of the simple pronoun is. But I go further. In his zeal for pronominal roots he seems positively to invent them, as for example ma (§ 368), u (§ 1,002), and above all his favourite sma (§ 165, &c.), of which he makes a most abundant, but I fear most unsatisfactory, use.

But it is a special office of Bopp's pronominal roots to supply a corps of prepositions, and accordingly he lays himself out for at least an easy solution of the problems likely to present themselves. The ideas of 'above' and 'below,' of 'before' and 'behind,' of 'in' and 'out,' stand in the relation of opposite poles to each other. The metaphor is Bopp's own. Hence the demonstrative pronouns are admirably suited to act as the needful symbols for these ideas, and so, what is particularly convenient, as they signify at once 'this' and 'that,' 'on this side' and 'on that side,' from one and the same pronoun we may deduce prepositions of directly opposite powers (§ 995). Thus from the pronoun a, to take that first as exhibiting the most wonderful fertility, with the aid of various suffixes, whose meaning seems to be a matter of not the slightest moment, for he never stops to explain them, we have S. a-ti 'over,' S. a-dhas 'under;' Lith. a-nt 'up,' Germ. ent, Lith. a-t 'to,' 'back;' S. a-dhi 'over,' 'up' (§ 997), with Lat. ad 'to;' S. a-pi 'over,' 'up' (§ 998), with επι; S. a-bhi 'to' (§ 999), with αμφι, Lat. amb or am 'round,' Germ. bei, and Lat. ob; S. a-pa 'from' (§ 998), with a-πο, Lat. a-b, Eng. o-f (the hyphens are Bopp's); and (§ 1,007) from a-pa itself, through an intermediate apara-s 'the other,' cut down to para, we have no less than five S. pre-positions,—viz. pra 'before,' prati 'towards,' para

'back,' 'away,' puras, and pari. Of these again pra (insepar.) 'before' has for its cognates  $\pi\rho o$ , Lat. pro, Germ. ver. Then prati (§ 1,008) is represented by  $\pi\rho o\tau\iota$  and  $\pi\rho os$ ; while parâ 'back,' 'away' (§ 1,009), gives us  $\pi a\rho a$ ; and through a second aphaeresis a prep. ra 'back' in some other language, which is one with the Lat. re 'back.' So much for one extensive family, all the progeny of the tiny pronoun a 'this' or 'that,' including too at once  $a\pi o$  and  $\pi a\rho a$ , at once pro and re.

To the S. pronoun u, if indeed such a pronoun exist, are to be referred, it seems, S. u-pa 'to,' S. u-t 'up;' as also the Gr.  $\dot{v}$ - $\pi o$ , Lat. sub, and the adj.  $\dot{v}$ - $\sigma$ - $\tau \epsilon \rho o$ - $\varsigma$ , together with Germ. aus, Eng. out. To meet the little difficulty about the asperate of  $\dot{v}\pi o$  and the s of sub, Bopp proposes two theories: 'The s is either a simple phonetic prefix or the remnant of a recently prefixed pronoun sa,' which however, he adds, would be 'here devoid of meaning.'

The S. pronoun ana gives birth to S. anu 'after,' Old Pruss. and Slav. na 'up,' and ava 'up;' also to S. ni 'down,' Germ. nie-der; also to S. ni-s 'out,' and perhaps to the Slav. i-su 'out,' 'which may possibly have lost an initial n.'—The loss is the more to be deplored, as we lose at the same time all resemblance between i-su and its parent ana.

Thus Bopp has thoroughly fulfilled the promises he held out, as we have from the same sources words denoting 'above' and 'below,' 'to' and 'from,' 'backward' and 'forward,' 'absence' and 'presence,' 'up' and 'down.' And then how magical the changes.

With this wonderful manufacture by the Bopp school of prepositions and case-endings from pro-

nominal roots, it may be useful to contrast a few specimens which may show the possibility at least of deducing prepositions and case-endings from verbs. Thus, to commence with a quotation from one of Bopp's own followers, we find in the 'Lectures' (p. 221): 'The instrumental (in Chinese) is formed by the preposition  $\dot{y}$ , which preposition is an old root meaning to use.' So in a little paper of my own (Proceedings, vol. vi. p. 120) it is stated on Premare's authority that the syllable commonly used in Chinese to denote the genitival relation, tci, is at times employed as a verb equivalent to the Latin proficisci. Again the Sanskrit inseparable preposition ni, Lith. nu 'down,' is to be identified with the Lat. vb. nu-, Gr. νευ-, 'lower,' 'hold down,' and the Chinese ni 'descend.' In the French chez, Ital. casa, and in our own through, Germ. durch and dur, we possibly have prepositions formed from substantives,—viz. the Lat. casa 'house,' and Germ. thür, Eng. door, Gr. θυρα. So little is it necessary to invent pronominal roots, as the source of prepositions.

On Bopp's derivation of particles from pronominal roots I must be brief. That words denoting 'yes' should be derived from pronouns signifying 'this' can surprise no one. Thus we assent at once to such a derivation of the Lat. sic and ita and si of the French, &c. But Bopp is bolder; he hesitates not to deduce the S. na 'not' and Lat. ne 'not' from his pronominal stem na 'this or that;' the Greek  $\mu\eta$  'not' from his stem ma; and the Greek 'a privativum' from a 'this' (§ 372, 1, p. 180). And here again he relies on his old doctrine that as such pronouns are qualified to denote alike 'this' and 'that' ('dieses'

und 'jenes'), in the second of these senses they may well represent negation, for what is there is not here. It is somewhat unfortunate that the pronoun a has on his own showing a marked tendency to express presence (§ 366), as a-tra 'here,' a-tas 'from here,' a-dya 'to-day.' Nor is this to be set down as a late innovation in the life of Sanskrit, for its position must have been already well established before the breaking up of the primeval language, seeing that (to use his own illustrations) it is found in the old Irish a-nochd 'to-night' of the far west, and in the Ossetic a-bon 'to-day' of the far east. But be this as it may, the same pronominal a, once firmly possessed of negative power, is deemed by Bopp a fitting symbol for past time. 'I hold the augment,' says he, 'the initial a in a-bhavam "I was" for example, and so corresponding to the syllabic augment  $\epsilon$  of  $\epsilon$ - $\tau \nu \pi \tau$ - $o\nu$ , &c., to be in its origin identical with the a privativum, and look upon it as expressing the negation of present time.' Nay even in such forms as leg-ê-bam (the division is Bopp's) he once thought the long quantity of the middle vowel was referable to a suffixed augment, but his confidence in this theory was ultimately shaken (§ 527).

Even among the verbs he is inclined to think that his pronouns play a part over and above their use in the personal endings. Of the suffixed  $\tau$  in  $\tau \nu \pi - \tau - \omega$ ,  $\nu$  in  $\delta a \kappa - \nu - \omega$  and  $\delta \epsilon \iota \kappa - \nu - \nu - \mu \iota$ ,  $a \nu$  in  $\lambda a \mu \beta - a \nu - \omega$ , he speaks with the greatest hesitation, yet still (§§ 494, 495) 'the most probable explanation' is that they are one and all of pronominal origin, their office being 'to convert the abstract of the verbs in question into a concrete.' Nay even the so-called connecting vowels, as in  $\phi \epsilon \rho - \sigma - \mu \epsilon \nu$ ,  $\phi \epsilon \rho - \epsilon - \tau \epsilon$ , must be ascribed, he thinks, to a similar origin

(§ 500), and indeed to our old friend a, for the o and e of the Greek verbs just quoted are represented in Sanskrit by an a.

I now leave the pronominal roots with a strong impression on my mind that Bopp has failed to derive from his theory anything that adds to the value of his book. Even in his other division of roots I cannot divest myself of a fear that he has been wanting in caution. In § 109 b he gives us a list of thirty-two root-verbs. In looking over these I find at least fourteen which I have little doubt are secondary, that is, derivative verbs, and eight others that have been shorn of their fair proportions, having lost an initial or a final consonant, or both. On the present occasion I cannot deal with more than a few of them, but to avoid all suspicion of undue selection, I will take a batch that follow one another, those which stand 3d, 4th, 5th, and 6th in his series. The verb gnd (or jnd) is of course the Lat. gnosc-o, Eng. know, but in these verbs all that follows the liquid constitutes a suffix, while our obsolete English vb. ken, or rather con, exhibits the simple verb; and, as I have already noted, the Latin participles a-gn-itus and co-gn-itus are deduced from compounds, not of gnosc-o, but of a primary verb gon, corresponding to our con. The 4th in the series, và 'blow,' has suffered curtailment of its final consonant, and is really one with the 17th, an 'blow,' which has lost its initial consonant, the two being truncated forms of a fuller van which appears scarcely altered in the Germ. wann-en, and is the parent of our winn-ow, wind, and fan, as also of the Latin vannus and ventus. This double corruption of van to va and an would be exactly parallel to my

assumption that the Lat. ce and en come from ken. The 5th sta, Lat. sta, though very generally set down as a root-verb, has a suffix, or rather the remnant of a suffix, in the a. The proof of this I find in the Latin sist-o as compared with gign-o, γιγν-ομαι, μιμν-ω,  $\pi \iota \pi \tau - \omega$ , for as these are admitted to be reduplicated forms of γεν, μεν, πετ, so sist implies a primitive set, or something like it. To this primitive I assign the idea of 'stop,' a verb which is itself probably of the same stock, st-op; and I quote in support of this translation the familiar siste viator or better still s. aquam of Virgil, s. lacrimas of Ovid, s. alvom of Pliny: I say better, because there is in these phrases no trace of the upright position, which eventually attached itself to so many of the derivative forms. I may be asked here whether I propose to connect the assumed root set with the sed of Lat. sed-ere, sīd-ere (for seid-ere), &c. and our own set, sit. My answer to this is at present neither yes nor no; but on the logical side I see no difficulty, as we ourselves have the phrase 'to set up,' equivalent to the Lat. statuere. Again, if I am asked to account for the fact that sta- and its derivatives eventually possessed as an important part of their meaning that of standing or the upright position, I think I see two explanations. First the compound a-sta- in Plautus has the simple notion of 'standing up' rather than that of 'standing near,' so that the preposition is  $an (= a\nu a)$ , as in an-hela-re 'to send up a blast of air,' a-scend- 'climb up,' rather than the familiar ad 'to or near.' It should be noted too that it is precisely before an initial s that the Greek ava, commonly reduced to av, or rather ov, in the Aeolic dialect, becomes further reduced to a or o (Ahrens,

De Dialectis, 28, 1). The assumption that astare was in the end cut down to stare, has its parallel in our own truncation of arise to rise, for arise is the original form. This theory further explains in a thoroughly satisfactory manner the prefixed vowel of the Fr. état, étais, établir. But independently of this argument, if the original notion of stopping be considered in connexion with man, and it is of man that we commonly speak, the first result of stopping is standing.

The 6th verb & 'go,' though found alike in Greek, Latin, and Sanskrit, I believe to be doubly corrupted. Already it-er, com-it-ium, in-it-ium, ex-it-ium, comes (them. com-it-), pedes (them. ped-it-), claim a final t for the root, and the forms so familiar in Plautus, per-bīt-ere, inter-bīt-ere, red-bīt-ere, praeter-bīt-ere, e-bīt-ere (the last in Plaut. Stic. 608, according to the palimpsest), exhibit an initial b. I have marked the ias long on the uniform authority of Plautus, though Forcellini hastily assigns a short i to these words. Then as regards the simple verb, Ribbeck has done well to follow the guidance of Fleckeisen in exhibiting baetere as the reading of Pacuvius in vv. 227 and 255. Thus bat, the root of baetere (as căd of caedere), is the Latin analogue of Bav in Baiv-w, and so only a variety of uad 'go,' whence the imperfect tenses uadere, &c. We have here an explanation of the apparent anomaly in the corresponding French verb, which unites in the same conjugation a stem va and a stem i,—these, although wholly different in form, being in origin one,—as je vais, tu vas, il va, with i'irai, &c. These two verbs sta- and i- may indeed be pointed to as containing the best evidence

of the close intimacy between the Greek, Latin, and Sanskrit languages; but it is in Greek and Latin, not in the Sanskrit, that we find the truest forms of the two roots.

If it be replied to what I have here urged, that the Indian grammarians, when they put forward a so-called 'dhâtu,' do not claim for it the honour of being an ultimate root, nay, that they apply this term to the base of any verb, though it be doubly or even trebly a derivative, I still contend that Bopp applies to his words the very name 'roots' (Wurzeln), and that his whole argument implies that the verbs so called are ultimate forms.

It would not be right to be wholly silent on his treatment of matters connected with the conjugation of verbs, but I must limit myself to the use he makes of the so-called verb substantive, whether as or bha 'be,' though I may refer also to similar proceedings on the part of Professor M. Müller. That this verb is employed in the processes of conjugation I of course do not deny, for I have myself sought to explain many forms by means of it. For example, I have contended that such phrases as 'I am a-dining,' 'I am from dining,' 'I am to dine,' are found in many languages besides our own as formulæ of presents, imperfect or perfect, and of future verbs; but then it is in the prepositions a (Ang.-Sax. an), from, and to that I find the essential part of the tense-idea. Indeed the very fact of the verb 'to be' entering into all the three phrases is the best proof that it contributes but little to the notation. But Bopp and his pupil proceed with far greater boldness. Thus the latter ('Lectures,' p. 174) tells us: 'Bam in cantabam was originally an inde-

pendent auxiliary verb, the same which exists in the Sanskrit bhâvami and in the Ang.-Sax. beom "I am". Again (p. 234) he says: 'In the Latin bo of amabo we have the old auxiliary bha "to become," and in the Greek futures in  $\sigma \omega$ , the old auxiliary as "to be".' (See also Bopp, § 526 and §§ 648, 656.) This is to give to the past imperfect and the future of the Latin the very same origin, so that the Romans, it would seem, thought it no inconvenience to confound the two opposite ideas of time. Let me note too that the author of the 'Lectures,' by quoting in the one case the first person of the Sanskrit verb and in the other the mere base or 'dhâtu,' gives a deceptive plausibility to his argument, for one sees some resemblance to bam in bhavami and some resemblance to bo in bha. My own views on the formation of the Latin tenses am-ab-a-m and am-ab-o are given elsewhere (Trans. Philolog. Soc. 1856, pp. 308, 309). I will here merely repeat that I find the symbol of past time, not in ba, but solely in the final a of am-ab-a-m, just as I find it in the corresponding vowel of the Latin er-a-m, Gr. nv  $(=\epsilon a\nu)$  or  $\epsilon - \tau \iota \theta \epsilon - a$ , and S. a - bhav - a - m. I have said that the two German Professors explain the σ of λεξω as the substantive vb.; but according to Bopp it is equally applicable to the agrist elega (§ 542) and to the perfect τετελε-σ-μαι (§ 569). Nay even the κ of εδωκα and δεδωκα is deduced from the same source (ibid.), a change which will prepare us in some measure for a still bolder doctrine, that the strange k which appears in the Lithuanian imperative  $d\mathring{u}ki$ 'give,' is also a variety of the s of the substantive verb (§ 680). As to the office it performs in this place, as in the others, not a word is vouchsafed.

As a final specimen of the sort of reasoning which is allowed in the explanation of tense-forms, I may point to a passage in the 'Lectures' (pp. 317, 318). From such phrases as 'I have loved,' 'amatum habeo,' it is inferred that the notion of 'habeo' is specially fitted to denote the past or perfect, the fact being that the essence of this idea lies in the dental suffixes of ama-t-um and lov-ed. And then, as something parallel, the writer quotes a Turkish phrase, which he tells us is literally 'Paying belonging to me,' but practically signifies 'I have paid.' I fear his knowledge of Turkish is not of the soundest, for at any rate the Latin phrase 'soluendum est mihi' and the English 'I have to pay' sound more like future than past tenses.

I shall conclude my comments on the 'Vergleichende Grammatik' with a brief notice of the free use made by Bopp of grammatical figures as they are called, and these too of the very class which the soberer philologers of late years have been disposed to reject as inadmissible, except in rare cases—I mean the figures which imply an extension of words, whether at the beginning or end or within the body. Bopp's much-used terms vorschlag, einschiebung, and zusatz, strengthened occasionally by the epithet unorganische, stand in the place of our old friends prosthesis (or prothesis), epenthesis, and paragoge. To the curtailment or compression of words no reasonable objection can be made, as it is the general law of language that forms should be abbreviated.

I propose to take the said figures in order.

Prothesis. The initial vowels of the words ανερ-(V. G. 2d ed. vol. i. p. 550, note), ονοματ- (ibid. 1st ed. p. 311, note), οφρυ- (ibid.), ονυχ- (ibid.), are declared to be inorganic additions. The first of the set is further declared to represent the Sanskrit nr or nara; but unhappily for this doctrine the noun ανερhappens to be the example given by Dionysius of Halicarnassus, when he is speaking of Greek words that originally had the digamma; and as this letter w habitually interchanges with an m in many languages, there arises a strong suspicion that  $Fa\nu$ - $\epsilon\rho$ - has its root in the first syllable, and so is identical with our own man. This is further confirmed on the one side by the English corruption of man to one (pronounced with a digamma) in such forms as one says and no one, compared with the German man sagt and nie-mand, and on the other by the Greek compounds ποι-μανωρ and Αναξι-μανδρος compared with στυγ-ανωρ and Αλεξ-ανδρος. 2. As ονοματ- is always held to be one with the Latin nomen, and as this, being a derivative from nosco, must originally have had an initial g(cf. co-gnomen, a-gnomen), we are driven to an older γον-οματ-, of which γον alone is radical. Indeed Bopp himself in his Glossary (s. v.) deduces the Sanskrit naman from  $jn\hat{a}$ . 3.  $O\phi\rho\nu$ - being compared with the Sanskrit bhrû (gen. bhruv-as) is pronounced guilty of having in its first vowel something to which it is not entitled. But let us rather compare it with our own eye-brow, to which eye contributes no small portion of the meaning. Surely then if a reasonable explanation can be given of the Greek word, such as shall include the idea of 'eye,' we shall have what is more satisfactory. Now the most familiar root-syllable for 'eye' or 'seeing' is in Latin oc (oculus), and in Greek with the usual letter-change οπ (οπτομαι). But before an

asperated letter on will of course become oo, as in  $o\phi$ - $\theta a\lambda \mu os$ . I suggest then that  $o\phi \rho v$ - stands for οφ-φρυ-, or I should myself prefer to say οφ-ρυ-, seeing that the Greek language habitually drops an initial labial when followed by ρ. Thus we have ρηγ-νυμι rather than Fρηγ-νυμι, Eng. break, and ραγ-rather than Fραγ-, Eng. berry. 4. The noun ον-υχ- I have little doubt is to be divided as here marked; and I say so partly on the evidence of the Latin unqui-s, unq-ula, uncus, and the Irish ionga, partly because  $v_{\chi}$  is a wellestablished Greek suffix, as seen in ορ-υχ- 'dig' (ορυσσω), the sb.  $\delta \iota - \omega \rho - \nu \chi$  'a trench,' and virtually in  $o \rho - (\nu) \chi - o$ 'a trench' (especially for vine-planting), and so closely related to the Lat. or-d-on-, which has precisely the same for its first and original meaning. Compare too for suffix  $\beta o \sigma \tau \rho - \nu \chi -$ ,  $\beta o \sigma \tau \rho - \nu \chi - o -$ ,  $\beta o \tau \rho - \nu \chi - o -$ , as well as βοτρ-υ-. Indeed most nouns in u have lost a final guttural, as the Latin genu-, metu-, anu-, contrasted with genuc-ulum (Eng. knuck-le), metuc-ulosus, anicula. I might also have included the suffixes vy and  $\nu\kappa$ , of  $\pi\tau\epsilon\rho$ - $\nu\gamma$ -,  $\kappa a\lambda$ - $\nu\kappa$ -, as of the same origin with  $\nu\chi$ . I am myself too further moved by the long-established belief in my own breast that words with an initial nhave generally suffered decapitation.

Epenthesis. This doctrine is called in aid by Bopp not unfrequently, but especially when dealing with the genitive plural of certain vowel-ending Sanskrit nouns (§§ 246, 249), which he says 'insert a euphonic n between the ending and the stem.' Among the instances he gives of this 'inshoving' are aśvā-n-ām 'equorum,' trī-n-ām 'trium,' sānā-n-ām 'filiorum.' And he notes it as something very remarkable that the Zend, the Old German, Old Saxon, and Ang.-

Saxon exhibit a similar peculiarity. Surely then he ought to have asked himself whether this n may not be the substantial part of a genitival suffix. Had he done so he would have found, I think, abundant evidence in his own and other cognate languages. I have myself long been satisfied with this explanation of the en of the German compounds mond-en-licht, has-enlage, and our own earth-en-ware, Ox-en-ford, Bucken-ham and its equivalent Buck-ing-ham, as well as the adjectives wood-en, lin-en, silk-en, &c. And then again we have in as a genitival suffix in Gaelic, as bo-in from bò 'cow.' It is the more remarkable that Bopp should have failed to hit this explanation, when he himself interprets (§ 248) the sâm of the Sanskrit tê-sâm 'horum,' tâ-sâm 'harum,' as containing a double suffix, of which is represents the genitival element so familiar in the singular. Secondly, in § 97 and again in  $\S$  727, note, he further teaches that while a final nin Greek has often originated in a final s, such interchange is confirmed by the Prakrit. On this view  $t\hat{e}$ - $\hat{s}$ - $\hat{a}m$  and  $a\hat{s}v\hat{a}$ -n- $\hat{a}m$  would go well together.

Again, as an n is ever apt to become silent before an s (cf.  $\epsilon\iota s$ ,  $\chi a\rho\iota \epsilon\iota s$ ,  $\tau \nu \phi \theta \epsilon\iota s$ , cosol, toties), it would have been more prudent perhaps, when dealing with the suffix of the dat. pl. in Old Prussian, mans, not to have considered the n as inorganic, on the sole ground that mas would agree better with the Sanskrit bhyas. His illustration too from the Latin ensis and mensis beside the Sanskrit asis and masis involves a similar assumption.

But we need not hunt up particular instances, when we find a wholesale manufacture of epenthetic vowels established by A. Kirchoff in the 'Zeitschrift'

(i. 37) and K. Walter (ibid. xi. 428). Thus ερεβινθος and oposos and the Old German araweiz of like meaning are convicted of having stolen the vowel which follows r on the sole evidence that the Lat. ervum exhibits no such vowel. Ηλεκτρον cannot be entitled to the vowel  $\epsilon$ , because for sooth the S. ark 'shine' proves the original root to have been alk. Again, the Greek having the two forms opoyula and opyula, the former is declared to have a vowel that does not belong to it, in spite of the evidence of ορεγ-ω. Nay, even the long vowel of αλ-ω-πεκ- is 'eingeschoben.' Walter's argument turns chiefly on the assumption that forms ending in rk, lk, rg, &c. are ultimate roots. Thus, according to him, ωλακ-, Γωλακ-, αυλακ-, αλοκ-, all varieties of the same word, signifying 'furrow,' come from a root  $valk = F \in \lambda \kappa$ . Now my own conviction, founded on a long and wide examination, is that such verbs are all of them secondary. I do not believe in his suggestedde rivation of αυλακ- from Feλκ-; but if it were true, the Latin uel- (uello-) exhibits the verb in a simpler form. But it is enough to place beside each other such pairs of words as talk and tale, hark and hear, pluck and pull, sparg- and omeip-, terg- and τειρ-, calc- and heel, stirk and steer, holk and holl, both Scotch verbs signifying 'to dig,' the latter of which is one with the Latin col- 'dig.'

Paragoge. Bopp's instances of 'unorganische Zusatz' are numerous, but I shall be satisfied with quoting the Latin genetric- 'mother' and iunic- 'heifer,' which are declared to have a c of this character, inasmuch as the Sanskrit janitrî (§ 119) and yûnî (§ 131) have no such letter. The Greek vocative γυναι by the side of γυναικ-ος, &c. might have suggested the possibility of

a final  $\kappa$  being lost; and, again, the Latin vb. nutri-re, being a denominative from nutric-, has suffered the same loss.

His use of Metathesis however is carried to the greatest extreme. Indeed, the term 'Umstellung,' which is his name for this 'figure,' incessantly presents itself to the eye. I am one of those who believe the doctrine implied in these words to be carried to an unjustifiable extent by even the more sober of philologers; but I will here confine myself to three examples selected from Bopp's book, which I cannot but expect all persons will agree with me in condemning. In § 308, p. 60, he takes in hand the Gothic adj. hanfa (nom. hanf-s) 'one-handed,' and first pronounces ha to represent the ka of the Sanskrit êka 'one.' This assumed, he holds the residue nfa to stand for nifa. By transposition of nifa he then gets fani, which would correspond no doubt with all accuracy to the Sanskrit pâni 'hand.' This taken altogether must be admitted to be a strong proceeding; and a German philologer, in discussing a Gothic word, would have done well to cast an eye for a moment on the other Low German and kindred dialects. Bopp done so, he would have found at home that for which he travels to the far East, viz. Old Norse hnevi 'fist' and Lowland Scotch, not to say Yorkshire nieve. Nay, Walter Scott ('Guy Mannering,' xxiv.) has: 'Twa land-loupers . . . knevelled me sair aneugh or I could gar my whip walk about their lugs;' and, to quote from a more Southern dialect, Shakspere has: 'Give me your neif' ('Midsummer Night's Dream,' iv. 1), and: 'Sweet knight, I kiss thy neif' ('Henry IV..' Part II. ii. 4).

In vol. i. 580, note, attention is drawn to an Armenian noun signifying 'man,' of which the crude form is said to be aran. Of this the initial vowel is first discarded as a mere phonetic prefix, and then by 'Umstellung' ran is identified with Sanskrit nar or nr. Would it not be simpler and quite as justifiable to affirm that the Armenian aran was formed from the Sanskrit nara by reading it backward?

Lastly in his Glossary s. v. nakha 'nail' we have the words: 'hib. ionga fortasse litteris transpositis e nioga.' The Greek  $ov-v\chi$ - should have prevented this statement.

In terminating my remarks on Bopp's somewhat free and bold use of 'grammatical figures,' I must be permitted to throw out the hint that if by any possibility the Sanskrit forms just compared with the classical have been advanced to a dignity which is beyond their due—in other words, if they are, after all, the more degraded of the two-then all the difficulties which have presented themselves disappear. From the objectionable figures prothesis, epenthesis, and paragoge, we should pass respectively to aphaeresis, synaeresis or crasis, and apocope. In plainer English, instead of assuming words to grow and extend themselves, we should have nothing but abbreviation, a principle which seems to recommend itself to the common sense of every one. A man need not be much of a philologer to account for the abbreviation of caravan, forecastle, and cabriolet to van, foxel, and cab.

In concluding these remarks, the length of which find their only excuse in the importance of the subject, I must be permitted to say that I have written in no spirit of hostility either to Comparative Grammar or to the Sanskrit language. On the contrary, fully believing that the science must be benefited when the philologer extends his views over many languages, especially in the older varieties, but to the exclusion of none, I sincerely trust that some of our own classical scholars will apply themselves with independence and diligence to the study of Sanskrit. My chief object in the present paper has been to check that slavish sequacity which has long interfered with the advancement of linguistic science, and I lay down my pen with something like a conviction that my readers will not so readily give their assent to such propositions as the following. Prof. Max. Müller tells us ('Lectures,' p. 167) that 'His (Bopp's) work will form for ever the safe and solid foundation of Comparative Philology.' Again (p. 216), 'Comparative Grammar has well-nigh taught us all it has to teach.' And another writer, if indeed it be another writer (Saturday Review, Jan. 10, 1862), speaks of Comparative Grammar as 'a science which has always prided itself on the exactness and almost mathematical precision of its method.

## XIV.

## POSTSCRIPT.

I had hoped that the arguments put forward in this paper would have drawn out some reply in print from the Sanskritists in Germany and England. Six years have now passed since it was printed. But, with one exception, they have been silent. That exception is Prof. M. Müller, who, in the second series of his 'Lectures' (pp. 13, 14), says:—

'But while we are thus told by some scholars that we must look to Polynesia and South Africa if we would find the clue to the mysteries of Aryan speech, we are warned by others that there is no such thing as an Aryan or Indo-European family of languages, that Sanskrit has no relationship with Greek, and that Comparative Philology, as hitherto treated by Bopp and others, is but a dream of continental professors;' to which he appends as a note:—

'See Mr. John Crawfurd's essay On the Aryan or Indo-Germanic theory, and an article by Professor T. Hewitt Key, in the Transactions of the Philological Society, "The Sanskrit Language as the basis of Linguistic Science; and the labours of the German School in that field—are they not overvalued?"

Now the word 'others' is a plural, and the note

naturally suggests the idea that Mr. Crawfurd and Mr. Key are included in the term. But Prof. M. Müller well knows that I have always accepted the Sanskrit language as a member of the Indo-European family, the study of which is important for linguistic science. Indeed, although my other engagements have rendered it impossible for me to acquire any direct acquaintance, much less a thorough acquaintance, with the language, I have read largely and with care what others have written on the subject; and have not unfrequently employed the knowledge so attained in the explanation of Latin words<sup>1</sup> and Latin grammatical forms. I therefore here call upon him to withdraw or to justify his assertion. Perhaps he will think this the more necessary, when I tell him that a friend, well known not more for accurate and refined scholarship than for caution and urbanity, on reading the above passage from his 'Lectures' made the remark: 'I call that a suggestio falsi.'

But while this volume is going through the press, the 'North American Review' (Oct. 1867, p. 521) brings me a paper written in a very different spirit, and claiming the more attention, as report from several quarters ascribes it to a distinguished Professor of Yale College.

After reading this article, I rise with the satisfactory feeling that my inquiry into the doings of German Sanskritists has not been in vain, for the last paragraph of the review, so far as concerns my criticisms of Bopp, runs:—

<sup>&</sup>lt;sup>1</sup> As in the explanation of the Latin words temere and temerare. (See Trans. Philolog. Soc. for 1866.)

'In a considerable portion of the criticisms which Professor Key makes upon his (Bopp's) works, the majority of comparative philologists, we believe, of the German or any other school, would be free to join, yet without abating a jot of the admiration and gratitude which they pay to the founder of their science.'

Again, in p. 530, he says:-

'In two respects, especially, his (Mr. Key's) objections are to be regarded as valuable protests, requiring to be well heeded, against modes of etymologizing which are too common among Sanskritists: namely, the over-ready referral to a Sanskrit root, of doubtful authenticity and wide and ill-defined meaning, of derivatives in the various Indo-European languages; and the over-easy persuasion that the genesis of a suffix is sufficiently explained when it is pronounced "of pronominal origin."

And he then goes on to say:—

'As regards the former point, we think our author entirely justified in casting ridicule upon the facile derivation of words meaning "water," "earth," "cow," and the like, from alleged Sanskrit roots claimed to signify "go."

Soon after he adds:—

'As regards, again, the use of pronominal elements in explaining the genesis of grammatical forms, we deem Professor Key's interpellations not less in place.'

And at the close of the same paragraph there

occurs :---

'Meanwhile, no one is to be blamed for feeling a kind of indignant impatience at seeing this and that ending complacently referred to such and such a pronominal root, as if no further explanation of it were necessary to satisfy any reasonable person.'

So far then we agree; but there are points as to which he expresses somewhat vaguely a difference of opinion.

It has been however often said that if two opponents were brought together face to face, an amicable discussion would result in a belief that their differences were far less than at first supposed. This is a truth which applies, I believe, to the present case; and perhaps a few additional words may lead to the same result.

The reviewer opens his argument (p. 521) with a statement that 'the change of ground and of point of view which philological science has undergone during its later history amounts almost to a revolution, and naturally provokes the opposition of ancient opinion and of the prejudices engendered by it;' and he includes me among the 'conservative spirits who are under such influence.' I think that few readers of the present volume will think that he has been happy in his theory that I am scared by innovations in linguistic matters.

Again, in p. 535 he observes that while the labours of the German school are overvalued by some, they are 'undervalued by those who, on account of faults of detail, reject the whole method, as well as by those who, having the acuteness to detect such faults, yet lack the sound learning and enlightened judgment which should enable them to adopt the method wherever it is truly valuable. And we fear that our author is to be ranked in the latter class.'

How he jumps to this conclusion I do not see. In

the first place, it is scarcely correct to say that the objections urged by me are only 'faults of detail.' Many of those objections deal with the backbone of Bopp's work, as, for example, his assumed explanation by pronouns of the case-endings of nouns, as to which the reviewer fully coincides with me. His space did not allow him, he says, to discuss more than a few of the difficulties raised by me; and thus it happens by a strange piece of good fortune for me that in every one of these he is at one with me, except that he cannot altogether go with me in questioning the existence of pronominal roots as a separate class; but he does not enter into any particulars as to the ground on which this qualified dissent is based.

Nor is it enough to say that he was confined by want of space, for he deals with several minor matters which affect myself, but have little bearing on the main question. Thus it is a very unimportant matter whether I am right or not as to spelling 'asperate' with an e, which he attributes to 'a whim or a false theory.' Perhaps he may change his view when he calls to mind the grammatical terms spiritus asper and spiritus lenis, or the Greek adjectives Saous and ψιλος, applied in the same senses. Again, his linguistic peace of mind is sadly disturbed when he finds that I have the courage to assume that Finnish has a close relation as regards pronouns and grammatical forms with the Indo-European family. Not long ago it was deemed an over-daring act to claim a connexion for the Keltic with this family; and the time will come when even Germans will be startled on coming across a European race whose inflections for the dual and plural of the verb run:-

Dual: molsoimen, molsoiten, molsoikan.
Pl. molsoime, molsoite, molsoin;

forms which bear a strange resemblance to what is seen in Greek grammars. Still greater perhaps their surprise when they come in pronominal declensions to:—

mo 'of me,' to 'of thee,' so 'of him.'

And again, when they find that as the Persian uses the letters m, t, s, as suffixes to substantives with the meaning of 'mine,' 'thine,' 'his,' so precisely as suffixes of the same form the language I speak of presents them with,—

parne 'son,' parnam 'my son.'
nipe 'knife,' nipat 'thy knife.'
aija 'grandfather,' aijabs 'his grandfather.'

And the matter will perhaps be clenched, when they see before them *mocum*, *tocum*, *socum*, identical in meaning, still more than in form, with the Latin *mecum*, *tecum*, *secum*.<sup>1</sup>

The language in question is the Lapp, one so nearly akin to Finn that the admission of one as in any way cognate with the Indo-European will insure the admission of both. The one can only enter the privileged gate arm in arm with the other. Thus it is no such absurdity as the reviewer supposes, to draw arguments from the Finnish, so far at least as concerns the pronouns.

But although I find ken and cu as the two leading forms of the Finnish relative, and so appeal to them in support of my theory as to the origin of the thirdperson pronouns, that theory remains intact, even if

<sup>&</sup>lt;sup>1</sup> See Mr. Wedgwood's paper, Trans. Phil. Soc. 1856, p. 1.

such additional evidence be put aside. For the Sanskrit testifies in my favour, and the other members of the Indo-European family as well. To this side of my argument the reviewer has nothing to oppose.

I had forgotten to state how the reviewer treats that portion of my paper which is directed against Prof. M. Müller's views. A few words will suffice on this head. After demurring to my implied assumption that 'accusations made to lie against these two (Bopp and Max Müller) will attach to the whole cause they represent' (p. 528), he soon turns to my dealings with the latter (p. 529), saying:—

'As regards our author's other antagonist, Professor Max Müller, it is only in England that modern philology is looked upon as so identified with his name, that a blot on the one must be presumed to sully the other.'

And then after general compliments to this writer he concludes thus:—

'A notable example of his characteristic weaknesses is offered in his theory of phonetic types instinctively produced as the beginnings of human speech; a theory which forms one of the counts of Professor Key's indictment, and which we should not think of defending in a single point from the latter's hostile criticism. Rarely is a great subject more trivially and insufficiently treated than is that of the origin of language by Müller in the last lecture of his first series.'

Let me conclude then, in the absence of all other replies to my inquiries as put in the paper entitled 'Qvaeritvr,' with a statement that I am thoroughly ready to subscribe to the articles of linguistic faith in the Bopp school, so far as the reviewer states them (in pp. 549, 550), with this one qualification, that all or

nearly all these truths had been discovered before Bopp entered the field of philology.

'Bopp and his school have shown, beyond the reach of cavil, that the branches of Indo-European speech have sprung from a single stock; that they are not independent growths, upon which certain common elements have been ingrafted. They all count with the same numerals, call their individual speakers by the same pronouns, address parents and relatives¹ by the same titles, decline their nouns upon the same system, compare their adjectives alike, conjugate their verbs alike, form their derivatives by the same suffixes.'

On the other hand I hold that Sanskrit does not at present deserve the high rank assigned to it in linguistic science, and this partly because no one has yet attained to a knowledge of the language at all comparable in accuracy to that which the students of the two classical languages have reached; secondly, because as yet the Vedic language, which alone can pretend to a rivalry in antiquity with Greek, has so far been but little studied; and thirdly, because Sanskrit literature has no basis for linguistic study comparable in clearness of ideas to the Iliad and Odyssey.

Farther, I believe that in pureness of grammatical forms both Greek and Latin have often a marked superiority over Sanskrit. But the true course for the philologer is to study all these languages so far as the limited opportunities of each permit, and one at least of them thoroughly.

<sup>&</sup>lt;sup>1</sup> I have myself done something to complete this theory by the identification of the Greek  $\theta\nu\gamma\alpha\tau(-\epsilon\rho-)$  with the Latin filia. (Trans. for 1866.)

## ADDENDA, CORRIGENDA, ETC.

Page 6, line 24. For -ανα-κοκκυ- read ανα-κοκκυ-. Page 6, line 28. For -ῥαψωδε- read -ῥαψωδε-.

Page 13, line 1. Add after 'Secondly,' 'the notion of "back" enters into adim- "take back or revoke," as used in Dig. xxxviii. 4, 1, §§ 3 and 4: "Assignare autem quis potest (libertum) quibuscunque uerbis uel testamento uel codicillis uel uiuus. Adimere autem assignationem etiam nuda uoluntate potest."

Page 47, line 27. For 'uninteresting,' read 'interesting.'

Page 49, line 4. Insert before 'also' the word 'compare.'

Page 64, line 31. Add: 'So Sallust (Jug. 18, 5) speaks of certain immigrants in Africa, who arriving by sea "alueos nauium inuorsos pro tuguriis habuere;" and in this way accounts for the shape of the Numidian huts: "Adhuc aedificia Numidarum agrestium, quae mapalia illi uocant, oblonga incuruis lateribus tecta quasi nauium carinae sunt." The same meaning of the adjective is seen in "duratur nasus incuruus, coguntur ungues adunci, fit bubo Pamphile," Apul. Met. 3, 213.'

Page 66, line 28. Add: 'So too in the French anévrisme, "an aneurism."

Page 82, line 1. For erbitten, read erbittern.

Page 89, line 19. For 'Garnet,' read 'Garnett.'

Page 107, line 31. For verchieben, read verschieben.

Page 113, line 23. For παρασκηνο-, read παρασκηνο-. Page 115, line 4. Add as an additional paragraph: 'So far I have dealt with the Latin per in the formation of compound verbs and compound adjectives; but even in the ordinary use of the word in connexion with substantives the sense of "over" is placed beyond doubt; and this more particularly in the text of Livy, as first (i. 26, 13): "Is (the father of the surviving Horatius) transmisso per uiam tigillo uelut sub iugum misit iuuenem;" secondly (xxvii. 32, 35): "Ibi equus pilo traiectus quum prolapsum per caput regem effudisset;" thirdly (xliv. 19, 9): "Antiochus . . ponte per Nilum facto transgressus . . obsidione Alexandream terrebat;" fourthly (x. 19, 21): "per uallum, per fossas irruperunt;" fifthly (xxvi. 6, 2): "elephantos transgredientes in ipso uallo conficiunt. Quorum corporibus quum oppleta fossa esset, uelut aggere aut ponte iniecto transitum hostibus dedit; ibi per stragem iacentium elephantorum atrox edita caedes." So Madvig in his text; but in his preface to vol. ii., part 2, he writes: "Recipienda fuerat Ussingii coniectura: 'ibi super stragem iacentium.' Caedes hominum per stragem elephantorum edita nihil est." I think I may now assume that there is no need for the conjecture of Madvig's collaborateur.

But the same use of *per* is seen in Catullus (20, 9): "Quéndam municipém meum dé tuo uolo ponte Ire praecipitem in lutum per caputque pedésque, &c.;" as also in Caesar (B. G. iii. 26, 5): "Hostes desperatis

rebus se per munitiones deicere intenderunt." Perhaps too I ought to add from Plautus (Poen. 5, 12, Geppert's ed.): "Ita repleuero atritate atr(at)ior multo ut siet Quam Aegyptini qui cortinam ludis per circum ferunt." In the passages so far quoted the notion of "over" seems alone admissible; but there are many others in which the same translation is at least as satisfactory as that by "through;" for example in "Quó Castalia pér struices sáxeas lapsu áccidit," (Liv. And. 36 Ribb.); "Dubií fauentem pér fretum introcúrrimus," (Naev. 59 R.); "Perque agros passim dispergit corpus," (inc. fab. 168 R.); "Ponti per freta Colchos delatus," (inc. fab. 182 R.); "Rapiunt per undas currus suspensos," (ib. 196); "Ardua per loca agrestia trepidante gradu nititur," (Pac. 272 R.); "Nunc per terras uagus extorris," (Att. 333 R.); "Multa siti prostrata uiam per," (Lucr. 6, 1262); "Transtra per et remos, &c." (Verg. A. 5, 663);
"Unctós saluere (they ran) per utres," (Verg. G. 2, 384). Still, as the Latin language had three prepositions of the same origin, per, trans, and super, it was to be expected that the meanings would for the most part be distributed between them; so that the notion of "over" might with many writers be limited to super. Lastly, to the verbs compounded with per in the sense. of "over" add percurr-, as used by Terence (Haut. iv. 4, 11) in "Curriculo percurre," run over, run across (to Charinus's).'

Page 119, line 10. Add as an additional paragraph:—

'The instances to which Diez refers are "Hygin. de condicionibus agrorum," p. 118, l. 6: pos legem datam; and M. Iun. Nissus, p. 294, l. 6: ut pos te

relinquas orientem; to which may be added from the same class of writers, "Casae litterarum;" p. 329, l. 12: Casa...pos si (= post se) finem habet, opposed to finis ante se habentem of line 3. So Munro in his Lucretius (4, 1186) writes poscaenia, and (4, 1252) in a foot-note prefers pos sunt to post sunt, the MSS. having possunt; but his reference to a solitary posquam as the reading of the sole MS. in Liv. (xlii. 10, 5) seems to have less weight, as postquam is a word of such frequent occurrence in Livy. Other instances are to be seen in Ribbeck's prol. to Vergil, p. 442, and Schuchardt's "Vokalismusdes Vulgärlateins, 1, 122." Few words then are better established in the Latin vocabulary than the form pos.'

Page 164, line 15. Add: 'mitterē scriptam solet (for so MSS.), Pseud. iv. 2, 46;' and to note 2 add: 'forē (Pers. ii. 3, 6), forē (As. 214, 57).'

Page 165, line 2. Add: 'uiuerē (Glor. iv. 6, 60), perderē (Curc. iv. 2, 18), adducerē (As. ii. 4, 32), noscerē (Rud. ii. 3, 59); and l. 10, add: 'redderē (Amph. i. 1, 52).'

Page 167, line 14. Add: 'and the German particle hin of like meaning.'

Page 210, line 33. After Liv. xxvi. 9 add: 'postremis genu nixis, Liv. xliv. 9, 6.'

Page 211, line 14. For invenis, read invenis.

Page 211, line 26. Add: 'clift, as in Netherclift by the side of cliff, and perhaps graft by the side of graff.'

Page 212, line 25. For 'imperfect particles,' read 'imperfect participles.'

Page 213, line 1. After 7, 4, add: 'So too the Danish preposition is i, not in.'

Page 215, line 2. Add: 'In the Dirae, v. 27, uirectis is the reading of two MSS. of the ninth century, B and Y of Ribbeck; and ought I think to have been admitted by the editor into the text. So in the Rosetum, l. 13, the same MSS. have frutectis, which is also found in the Cod. Harl. 2534.'

Page 217, line 11. Add: 'So also  $\kappa\rho\nu\beta\delta a$  for  $\kappa\rho\nu\phi a$ . Nor can the numerous adverbs in  $\delta\sigma\nu$  and  $\delta\eta\nu$  in my opinion be opposed to this view, for in these also a  $\gamma$  seems to have disappeared from before the  $\delta$ , just as a c has from such Latin adverbs as cateruat-im.  $\Gamma\delta\sigma\nu\pi\sigma\sigma$  too I should regard as older than  $\delta\sigma\nu\pi\sigma\sigma$ .'

Page 236, line 13. Add: 'Of course this theory assumes that such adverbs as breuiter ended at first in ēr. A change of this kind would be parallel to what has occurred in pater, mulier, &c. It is with some confidence too that I venture to assert that I have met with many cases in which old writers give a long e to the adverbs in er, although at the present moment I can only point to the Rudens (ii. 3, 65): "Vt lépide, ut liberálitēr, ut honéste atque hau grauáte;" the Epidicus (iii. 4, 49), "Reór, peccatum lárgitēr. Immo haéc east;" and the Eunuch (ii. 1, 24), "Fácie honesta; mírum ni ego me túrpitēr hodic híc dabo."

Page 247, line 18. For 'Hast.' read 'Haut.'

Page 262, note 1. Add: 'Because âmi is to be claimed for the suffix in bhar-âmi, to take this as an example, on the ground that the "dhatu" of the pronoun of the first person is asmat, and the plural forms of this pronoun, asmâ-kam and asmâ-bhis, point to the same result. But this admitted, a so-called causal verb, as vêd-ay-âmi (ich mache wissen)

must have ay for its suffix, a form which corresponds with all accuracy to ag or ac, the suffix of Latin verbs, and to  $a\chi$  of the Greek  $\tau a\rho a\sigma \sigma \omega$  ( $\tau a\rho -a\chi$ -), for a guttural between vowels would readily slip into a y. The usual doctrine of Sanskritists, that the a of bhar-ami is a mere connecting vowel, offends by its very extravagance. For such a purpose a short vowel alone can be admissible.

## INDEX.

The English Alphabet is here adopted, so that for Greek words  $\phi$ ,  $\chi$ ,  $\theta$  are considered as representing our ph, ch, th; while words with an initial asperate fall under h, and those commencing with  $\dot{\rho}$  under hr (not rh). Latin words are commonly given in the crude form with an appended hyphen, in other cases are marked L; while a.-s. denotes Anglo-Saxon, Boh. Bohemian, Bret. Breton, Dans. Danish, f. French, g. German, ga. Gaelic, go. Gothic, i. Italian, ir. Irish, Lith. Lithuanian, n. Norse, s. Sanskrit, sc. Scotch dialect of English, sp. Spanish, sw. Swedish, w. Welsh. o is in some cases prefixed to denote Old.
